1. What are Mutual Funds?

An opportunity to invest relatively small amounts of money with little or no fees or commissions in sound diversified investments managed by well-qualified investment professionals.

The Mutual Funds Concept

Let's assume that you have $1,000 to invest—and you hope to make this money grow. Suppose you took this $1,000 to a group of people whom you felt were exceptionally capable in the field of securities investments.

Suppose you said to that group, "Take my $1,000 and invest it for me. I expect you to diversify my investments, pay close attention to my money, buying new securities for me from time to time as investment conditions change. And for this I am going to pay you $5.00 a year."

Well, after the investment group recovered from the shock of the suggestion, they might reply, "It is completely impracticable for us to do what you ask for $5.00 a year. But if we can get several thousand people together and put your money into one joint account, it might become worth our while to handle this account as you suggest."

This is the concept of the mutual fund. The investments provide both the necessary capital and the financial reward for top-notch management. Mutual funds are the most logical way for investors to ensure *safety, liquidity* and *yield* for their investments.

How Mutual Funds Began

Although the roots of mutual funds go back to the 19th century British and Scottish investment trusts, the industry has enjoyed its greatest growth and success in the United States.

- ☐ The first U.S. fund, Massachusetts Investors Trust, began in 1924.

In the bull market of the twenties, M.I.T. and other funds were recognized as important vehicles that brought a broader slice of the public into the stock market.

- ☐ But 1929 brought the Depression. While closed-end (offering a fixed amount of shares), highly leveraged investment companies were the hardest hit, open-end (unlimited shares offered) investment companies suffered too.
- ☐ The Investment Company Act of 1940 created important statutory safeguards for investors, effectively curbing the worst fund abuses of the twenties.

Responding favorably to these regulatory safeguards, shareholder confidence grew and the mutual fund industry surged ahead.

- ☐ In 1940, assets of the mutual fund industry totalled only $488 million spread over 68 funds.
- ☐ By 1950, the number of mutual funds had increased to 98 and their assets climbed to $2.5 billion.
- ☐ In the next decade, the number of funds increased to 161 and total assets jumped to $17 billion in 1960.
- ☐ In 1972, industry assets peaked at an impressive $60 billion, but then declined in 1973 and 1974 in response to declines in stock values generally.

With traditional common stock funds declining in popularity, fund managers sought new ways to remain financially healthy. First, retrenchment became the order of the day. Between 1979 and 1981, several hundred funds merged with other funds or were liquidated, with their assets distributed to shareholders.

Smaller funds were particularly hard hit by inflation since the managers' income is derived not from sales charges, but from management fees based on the size of the funds' assets. Mergers became a way to offset these increased

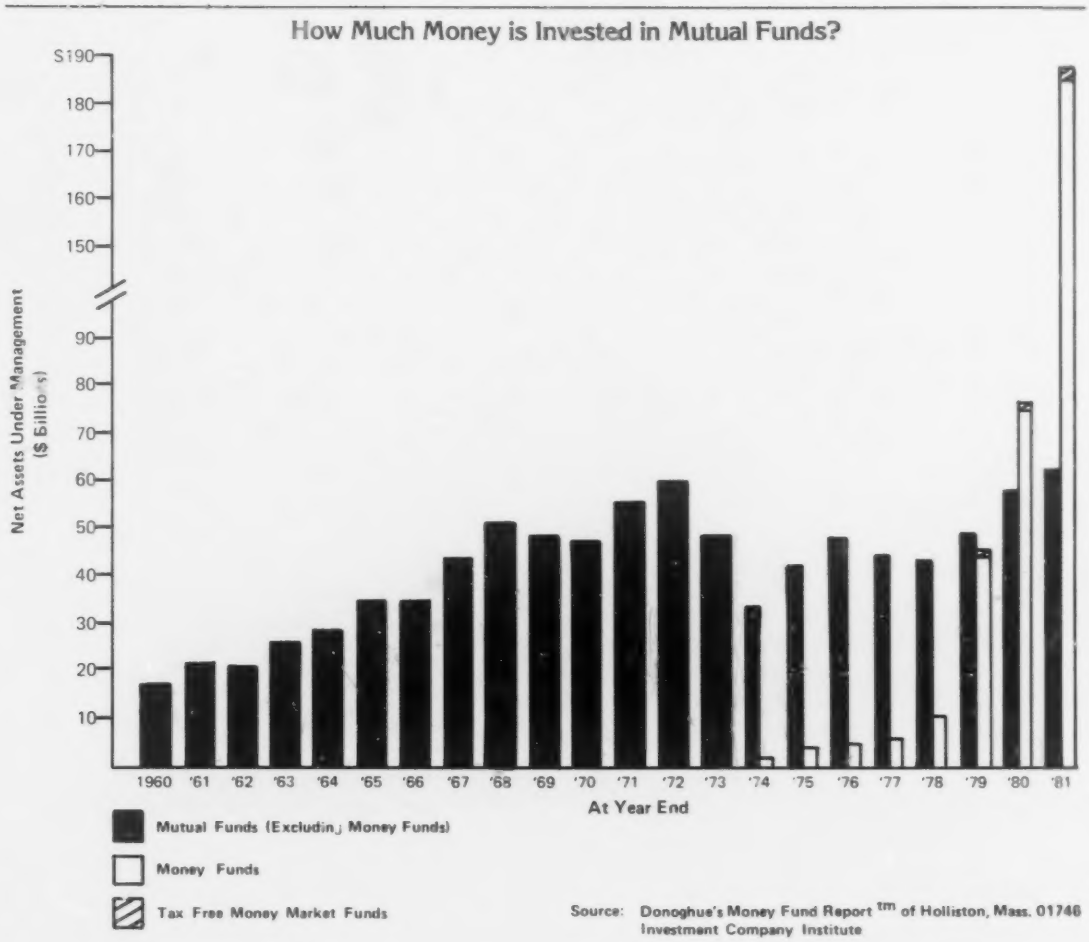

Figure 1. Spurred by rising stock prices in the 1960s, mutual fund assets under management grew steadily. However, by the mid 1970s interest rates in the money market skyrocketed to then historical highs and equity fund assets began losing ground to the newly emerging money market funds. As a result of money funds, the total net assets of all mutual funds has increased to over $240 billion by year end 1981. Assets of mutual funds excluding money funds have increased from $30 billion in 1974 to $54 billion by the end of 1981. During this period money fund assets have increased from $1.7 billion in 1974 to over $180 billion in 1981.

costs because the fees accruing to large funds more readily covered fixed costs of doing business. When two funds merge, duplicate shareholder costs are eliminated. There is one board of directors instead of two, and auditing and registration fees and taxes—expenses not closely related to size—are all reduced.

As the number of common stock funds declined, new types of funds were created.

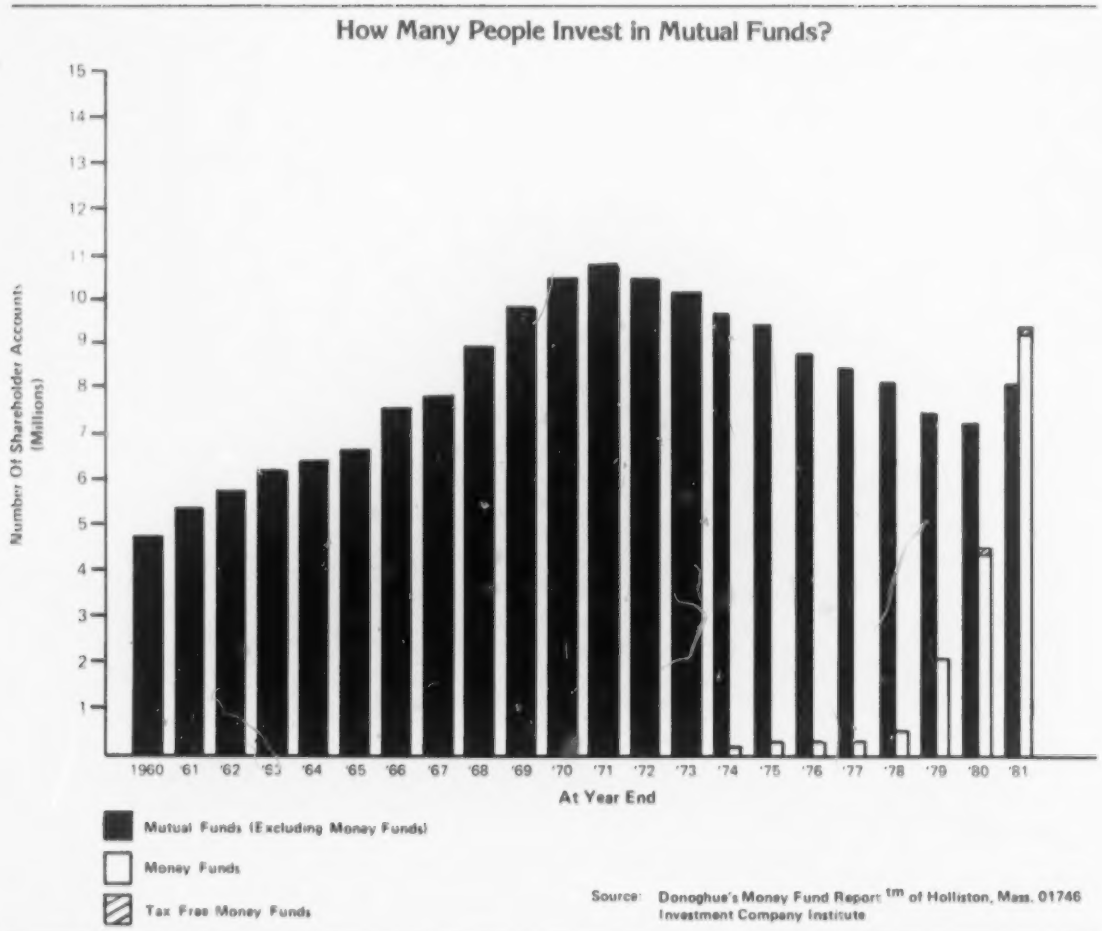

Figure 2. As assets under management began growing the number of mutual fund shareholder accounts increased. The increase in shareholders has been proportionally less than the increase in assets. This indicates that the average account size grew through the 1960s. The number of money fund accounts in relation to total assets has grown at an equivalent rate from the late 1970s to the present, indicating that the average account size did not appreciably change. Mutual fund assets reached a peak of over 10 million shareholders in 1971, exhibited a gradual decline and began rising in 1981 to approximately 8.5 million shareholders. Money fund shareholders grew from a mere 104,000 in 1974 to over 9 million.

☐ Money market funds were the children of 1974's interest rate crunch. As rates rose, money market funds enabled shareholders to obtain high yields that had previously been available only to those with $100,000 or more to invest directly in money market instruments—bank certificates of deposit, Treasury bills, commercial paper and other evidences of debt.

- Municipal bond funds were made possible by a 1976 revision of the tax law. Mutual funds entered the tax-free investment market.

Mutual Funds Today

With the advent of the money market funds, mutual fund assets have zoomed.

- At the end of 1981, total net assets for all mutual funds was a record $245.2 billion. Remarkably, $181.4 billion was invested in money market funds.

This year's *Almanac* reports 605 mutual funds, including 115 money market funds plus 16 closed-end and dual-purpose funds.

Who Invests in Mutual Funds?

Exactly who buys mutual funds? Basically there are two markets: the individual investor and the institutional investor.

The institutional market accounts for about 40% of all mutual fund holdings. More than two million bank trust departments, pension fund, foundation, union, and business accounts are invested in mutual funds.

Of the 17.5 million shareholders, an estimated 14 million are individual investors. Over 58% of these individuals are money fund shareholders.

Fund	Objective	Annual % gain or loss per share*					1977 to 1981		Initial Minimum/ Subsequent Investment ($)	Money fund available for switching	Method of Redemption

Table 1. You don't have to be wealthy to invest in top performing mutual funds. This table shows top performing equity funds with minimum initial and subsequent investments of under $500. Listed are the investment requirements, objectives and performance of the funds. With small initial and additional deposits you could have earned from 16.49% to 36.7% on your investment in the past five years.

2. Why Invest in Mutual Funds?

Mutual funds provide the individual investor an opportunity to earn high market rates of return with a relatively small investment in a diversified portfolio. For little or no fees or commissions, an investor benefits from professional management and the liquidity offered by mutual funds.

Diversified Portfolios

The principle of diversification is of utmost importance in minimizing the risks of investing. While investors cannot totally avoid "market risk," investing in an equity or stock fund enables them to avoid the risk of catastrophic loss that can occur in bear markets with their declining stock prices or when a company goes bankrupt.

In general, the value of a portfolio of securities will show less variation than the value of any one security. This is because the securities markets weigh many factors when determining the price of any given security—the situation of the issuing company, its industry, the type of security (common shares, preferred shares or bonds), and the situation of the overall economy. A portfolio composed of a wide variety of securities representing many companies in many industries will "net out" changes in value due to the changing circumstances of particular companies and industries.*

In a bear market with its declining stock prices, many investors fare worse than the averages.

- During the sharp decline in stock prices between December 31, 1972 and December 31, 1974, the New York Stock Exchange (NYSE) Index declined by 44% but the median unweighted price decline of all American Exchange (AMEX) and NYSE stocks was 65% and 50.3% respectively. About three-fifths of the total number of stocks on both exchanges fell more than 50%, while almost three out of 10 stocks plummeted 70% or more. Declines of this magnitude almost certainly hit poorly diversified portfolios with extra force.

Why would individuals select undiversified portfolios?

1. Some investors may seek to obtain high returns by selecting a relatively few issues they believe may perform in superior fashion. The corollary to this, of course, is that they are able and willing to assume a higher-than-average risk in search of these potential rewards.
2. Other individuals may have unusually large holdings in a family-controlled company.
3. Over a period of time, one or two securities with the highest returns will tend to dominate a portfolio if, because of tax considerations or other reasons, no adjustments are made.
4. Some investors do not understand the principles of diversification.

There are several other reasons for poorly diversified portfolios: Some individuals place great importance on controlling their own investments or may not count the cost of exercising this privilege. Other investors believe—rightly or wrongly—that they can outperform mutual fund managers and see no reason to pay professionals to manage their portfolios, even though fund charges incurred cover other services as well. Finally, some individuals who have portfolios of moderate size may be discouraged from seeking even the theoretical minimum degree of diversifi-

*The estimate of the theoretical minimum number of issues required to achieve adequate portfolio diversification is based on a study by Lawrence Fisher and James H. Lorie, "Some Studies of Variability of Returns on Investments in Common Stocks," JOURNAL OF BUSINESS, April, 1970. This study shows that reduction in risk as measured by the degree of dispersion (narrowing of differences between hypothetical portfolios showing the lowest rates of return and the market average) is very significant with increases in portfolio size up to eight issues and more moderate thereafter. For 10-year holding periods, however, a significant reduction in dispersion is shown with increases in portfolio size up to 128 issues.

The Advantage of Diversification: A Portfolio Shows Less Variation in Price Than Its Component Securities

	12/31/80	1/30	2/27	3/31	4/30	5/29	6/30	7/31	8/31	9/30	10/30	11/30	12/31/81
AT&T	0	8.9	8.1	7.8	15.1	20.9	17.5	19.0	13.9	20.9	24.3	24.0	22.7
EXXON	0	-3.6	-10.1	-14.9	-15.0	-19.7	-18.0	-13.2	-19.5	-22.8	-24.7	-18.8	-22.5
GM	0	2.2	11.4	1.5	20.0	23.6	17.8	14.2	2.2	-0.9	-18.9	-17.8	-14.4
MOBIL	0	-9.4	-15.5	-19.0	-27.3	-29.4	-25.7	-24.2	-29.8	-37.2	-35.0	-34.4	-40.3
TEXACO	0	-15.9	-16.9	-22.1	-22.4	-28.1	-26.3	-24.5	-23.8	-31.3	-32.3	-27.9	-31.3
TOTAL	0	-3.7	-4.7	-6.2	-4.9	-8.6	-8.4	-5.9	-11.4	-14.2	-17.4	-15.0	-17.1

THE ABOVE GRAPH SHOWS THE VARIATION IN PRICE DURING 1981 OF THE COMMON SHARES OF THE FIVE LARGEST U.S. COMPANIES. THE MAXIMUM MONTH-END PRICE CHANGE, ADJUSTED FOR DIVIDENDS, VARIED FROM 24.3% FOR AT&T TO MORE THAN 40% FOR MOBIL. YET, A PORTFOLIO COMPOSED OF THESE FIVE STOCKS HAD A MAXIMUM CHANGE OF ONLY 17.4%.

Figure 3. Diversification lowers risk to the investor by decreasing the variation in value of assets. The table and graph above show the percentage variation in price of the common stocks of five of the largest U.S. companies during 1981. The total figures are the percentage variation for a portfolio containing equal dollar investments in each of these securities at the end of 1980. The boxed percentages show the maximum change in price (positive or negative) during the year for each security and for the portfolio.

Each of the securities showed large percentage changes in price ranging from a +24.3% for AT&T at the end of October to a −40.3% for Mobil at the end of December. But the portfolio showed a maximum change of only −17.4%. To be properly diversified a portfolio should have significantly more than five issues. Mutual funds typically diversify their investments over scores of issues, significantly reducing the substantial price swings shown by even the most conservative stocks.

cation (eight issues) because the transaction cost of acquiring such a portfolio is significant. Costs, of course, may increase further depending upon the rate at which the portfolio is turned over.

The cost of diversification, even to the tune of 20 or 30 issues, is beyond the reach of most investors. Mutual funds, however, are able to achieve a high degree of diversification because the size of their transactions permits economies in cost.

With mutual funds, every purchase you make—whether it is a $10,000 lump sum pay-

ment or a $25 payment on an accumulation plan—is properly diversified. You can see the advantages for investors making periodic payments.

So, diversification can minimize risks associated with the poor performance of a particular security or industry group. Diversification, however, cannot protect investors from the risks associated with movements in the general market.

Lower Transaction Costs

With mutual funds, individuals benefit from the institutions' buying power.

Historically, commission rates on the NYSE were the same for a given stock regardless of how many round lots (100 shares) were traded. There were no quantity discounts. This structure developed before institutions became a force in the stock market, and despite the fact that costs incurred in trading huge blocks of stocks were lower and brokerage firms could still make money handling large institutional transactions at lower commission rates.

- ☐ On December 5, 1968, a new rate structure was established on the NYSE giving a discounted commission rate for trades of 1,000 shares or more.
- ☐ In 1970, 1972, and 1973 some further changes in commission rates were made, and on May 1, 1975, the Securities & Exchange Commission (SEC) completely abolished fixed commission rates for both institutions and individuals. Institutions were the prime beneficiaries of the ensuing all-out price war between brokerage firms.

The SEC has evaluated the effects on both institutions and individuals of the move to a free market system of commission rates. In the 12 months following the abolition of fixed rates, the SEC found that:

1. Commissions paid on the average institutional transaction had declined 35%, from .84% to .54% of the value of the average trade.
2. Commissions paid by individuals declined only 2%, from 1.73% to 1.69% of the transaction's value.

In terms of actual dollars paid per share, commission rates for institutions dropped 30%—from 26 cents a share to 18.2 cents. Rates for individuals declined 6% from 30 cents per share to 28.1 cents.

Professional Management

Professional management earns its keep. Professionals know how to structure a portfolio to achieve a balance of high yield consistent with the fund's restrictions on degrees of risk. By that we mean that if a fund describes itself in the prospectus as a growth-income fund, its managers will buy conservative stocks to achieve that purpose. Similarly, the people who manage performance funds will buy riskier stocks in order to shoot for greater rewards.*

In addition, fund managers provide cheaper and better execution of trades as well as many convenient custodial and bookkeeping services. They collect dividends and reinvest them, handle rights, warrants and proxies.

Mutual fund management companies are registered with the SEC as investment advisors. The SEC regulates them with the shareholder's best interests as its goal.

Liquidity

Your final reason for seeking a mutual fund investment is the "liquidity" it offers you. As an investor in a mutual fund, you have the right at any time to sell back to the fund—redeem—your shares.

In the case of no-load (no sales commission) funds, the investor traditionally has redeemed

*To illustrate: One of the tools modern fund managers use to achieve risk goals is beta analysis. Betas and a companion measure called alpha are a sophisticated way to measure risk and volatility based on complex statistical formulae called "least squares regression analysis." Betas measure risk by determining the historic volatility of a stock or a portfolio relative to the market. This type of analysis helps fund managers maximize profit for given levels of risk.

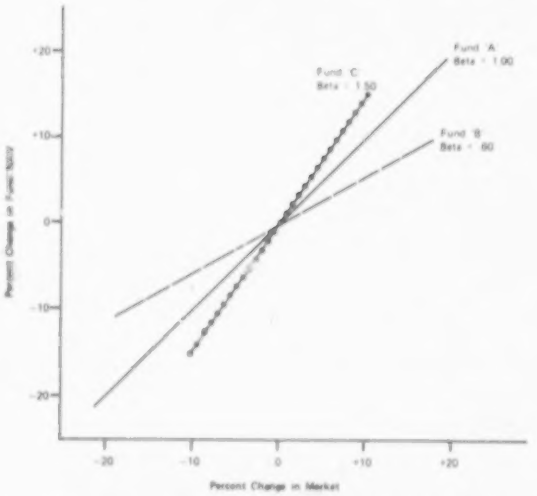
shares by sending a letter to the fund or custodian, but today, telephoning and check writing offer the advantage of almost instant liquidity.

With load funds, either a letter or a call to a qualified investment dealer will suffice.

In either case, you will receive the going market rate on your shares at the time your sell order is received by the fund.

Compare this ease of selling to other forms of investments. Real estate has appreciated greatly in recent years, but there are difficulties in disposing of such investments on short notice. Exotic investments such as art, diamonds, rare stamps and coins are now in favor, but in most cases the investor buys at retail and sells back at wholesale, or with sizable broker fees. Savings banks provide an investment guaranteed against loss (up to $100,000), but to achieve returns greater than the 5¼% typically offered in "regular" accounts, your money has to be locked up for varying periods of time. If you need money to buy a car, a house, settle an estate, or to meet emergencies, mutual funds can be liquidated easily.

Mutual Fund Portfolios Can Be Chosen to Achieve a Target Risk



A portfolio manager chooses the riskiness of his fund by his choice of the issues which make up the fund's portfolio. Risk is the volatility of the fund's net asset value with respect to the market. If a 10% change in the market causes a 10% change in the fund's NAV, that fund is said to be as risky as the market and has a beta of 1.00. Another fund (a 'performance' fund) might change 15%, and therefore its beta = 1.50. A conservative, balanced fund will exhibit less variation than the market (say, 6%) and have a beta of .60. Beta is the percent change in the NAV of a security divided by the percent change in the market.

3. No-Load vs. Load Funds

More than half the 605 open-end funds in this *Almanac* require no sales commission or "load." With no-load funds, the shareholder takes the initiative and bypasses salespeople and their commissions.

Traditional wisdom once offered by experts was to buy into the best fund regardless of sales charges. This advice, while valid, doesn't take into account that there are so many good no-load funds that there is no longer reason to buy a load fund in order to achieve superior performance. Since few investors need more than three or four funds to achieve personal investment goals, the selection of no-loads is more than adequate.

No Loads: Put ALL Your Investment Dollars to Work

A no-load fund has the same benefits as a load fund—the diversification of risk, mass buying power and professional management. But with no-loads, *all* your money goes to work. No-load funds provide the following advantages:

1. Greater flexibility in switching funds without commission penalties.
2. Satisfaction of self-selection from a wide array of available no-load funds.
3. Greater profits for the investor, since there is no need to pay commissions or fees.

The mutual fund industry is becoming more no-load oriented. The absence of a sales charge has become extremely important in the sale of income funds, including money market and municipal bond funds. A sales charge can easily wipe out the first year's income.

- ☐ At the beginning of 1967 there were 61 no-load funds. There are now more than 300 (including 131 money market funds), with 10 million shareholder accounts.
- ☐ In 1981 the no-loads accounted for 51.2% of total new sales in the mutual fund industry including load and no-load fund sales, but exclusive of money market fund sales and reinvestment of dividends. (Dividend reinvestment is still an important source of sales for the load fund.) In fact 1981 was the twentieth consecutive year of net sales for the no-load segment of the fund industry.

Load Funds: Sales Charges You Can Expect to Pay

In order to purchase shares of some mutual funds, you must pay a sales charge or load. This sales charge, typically 8½% of the purchase, covers the cost of distributing the fund's shares and includes commissions paid to the stockbroker or mutual fund salesperson who sold you the shares. On a $1,000 purchase, $85 would be a typical deduction, leaving $915 as the actual investment. Calculated as a percent of the money actually invested, the way stock commissions are, the load is actually 9.3%.

A special report published by the SEC in 1972 on load charges noted that some salespeople are tempted to advise customers to divide their money between two or more funds so that no breakpoint applies to any of the purchases. In the example given, if you were to invest $25,000 in one fund, paying a 6% commission, the salesperson would receive $1,500 and you would have $23,500 invested. If the same sum were split equally among three separately owned funds with the same commission schedule, the commission would be 8.5%. The salesperson would receive $2,125 and only $22,875 would actually be put to work for you.

For funds and single-payment contractual plans, the National Association of Securities Dealers rules provide a ceiling of 8½% on sales charges. The ceiling is reduced where sales plans fail to offer investors three rights:

1. If dividend reinvestment is not provided free of sales charge, the maximum load will be reduced 1.25%.

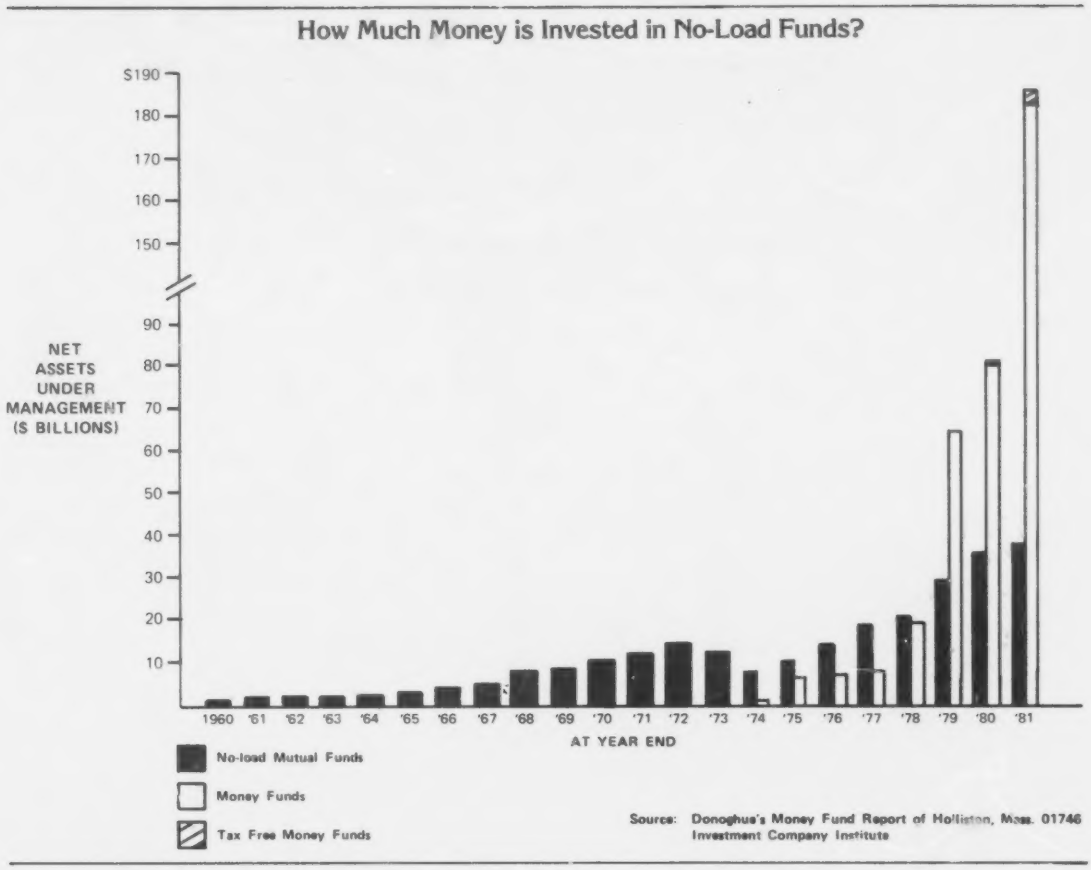


Figure 4. Assets managed by no-load funds—equity as well as money market—are at an all-time high. As investors continue to undertake the management of their own assets, no-load funds will continue to displace load funds as the preferred investment vehicle. No-load fund assets have grown from $1 billion to over $19 billion in 1981, while money funds have grown from $1.7 billion to over $180 billion in 1981.

2. A .50% reduction is mandated if rights of accumulation (cumulative quantity discounts for a period of not less than 10 years) are not provided.
3. A .75% discount reduction is mandated if quantity discounts on single purchases are not provided. An acceptable quantity discount plan, according to NASD is, at least, either (a) a 7.75% maximum for purchases of $10,000 or more and a 6.25% maximum for $25,000 plus or (b) a 7.50% maximum on purchases of $15,000 plus and 6.25% maximum for $25,000 plus.

There is an exception to these maximum rates for contractual plans. There are a number of funds that sell contractuals—Fidelity Destiny and IDS Growth, for example. Their sales charges, as shown in the statistical tables, can exceed 8½%.

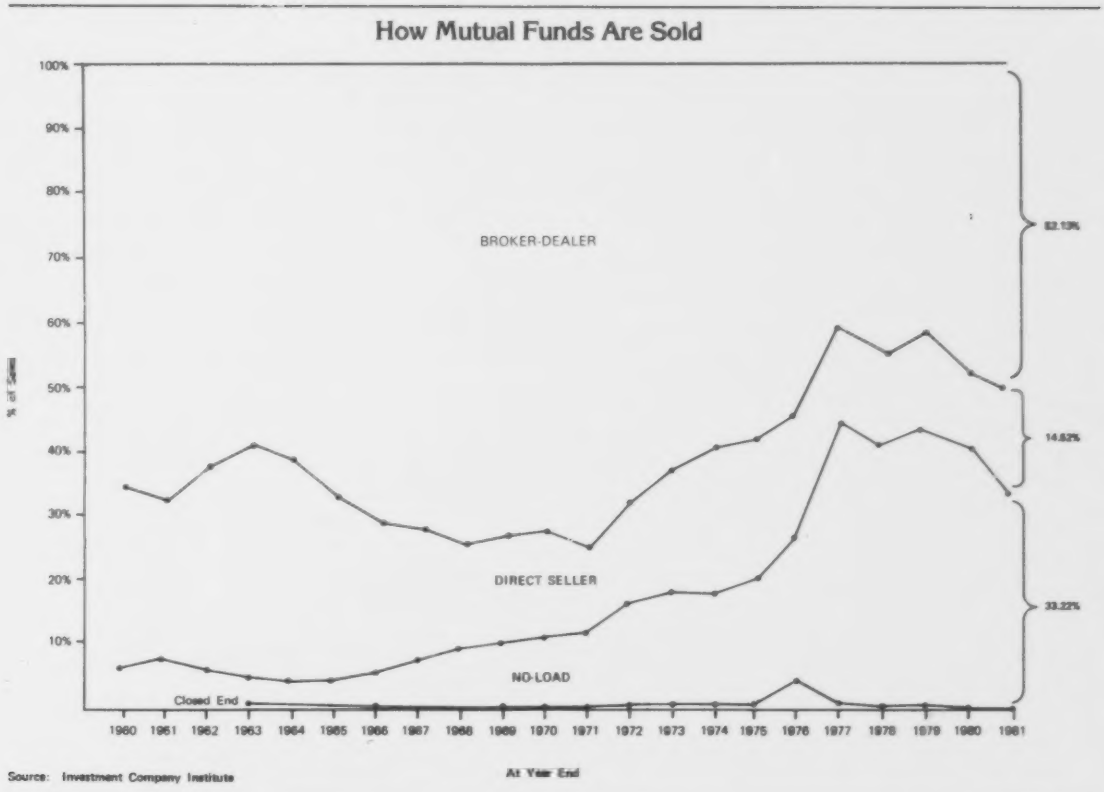

Figure 5. During the decade of the sixties, mutual funds were typically sold by the funds themselves or by broker–dealers. Each charged a commission to recover selling costs. The recent popularity of no-load funds shows that investors are exercising more initiative and that in the future mutual funds will be bought, not sold.

An Underwriting Commission Is a Load

When an investor buys a new or a secondary issue of stock, there is an underwriting fee paid by the issuing company. When an investor buys an underwriting of shares in a new fund, the underwriting fee is deducted from the amounts invested and is a cost to the investor as is the load paid to buy an existing fund.

What is going on here? Simply that some smart investment counselor found a new way to merchandise mutual funds. Stockbrokers and mutual fund salesmen could call clients and tell them a new fund was being offered, one to specialize in a potentially desirable area of "junk bonds." And there would be no load, only an underwriting fee of 8½%. Something for nothing? No way.

How to Utilize Salespeople and Brokers More Effectively

Mutual fund salespeople can be friend or foe—depending on how effectively you use their services. Most are ethical, looking out for the best interests of their clients. But, as always, there are

a few who put their own interests first.

The most important step you can take to protect yourself against these few unethical types is to understand your needs and to be knowledgeable about the funds you are buying. It's up to you to define your investment objective. Do you want a conservative, middle-of-the-road fund? Discuss your goals thoughtfully with salespeople. Don't leave the door open for them to recommend something that isn't right for you.

Learn as much as you can about mutual funds. The more you know, the easier it will be for them to assist you.

4. Switching Your Investment Among Mutual Funds

If you once purchased shares in a conservatively managed fund but now feel you can afford to take the risks that go with being a shareholder in a more aggressive fund, you may be able to switch funds without paying an additional 8½% sales charge.

This is possible when your fund is sponsored by a company which manages other funds too—usually with different objectives. There are more than 70 such management companies. Most of them have only two, three or four funds under the same management umbrella.

One advantage of share ownership in these funds is the *exchange or conversion privilege.* This allows you to move your investment freely from one fund to another fund in the series at no cost whatsoever—or only a minimal $5 service fee. Keep in mind, however, that any exchange of shares must be treated as a sale and new purchase for income tax purposes.

Investors in growth funds may find the exchange privilege useful as they approach retirement. At this stage of life, they may be more comfortable with the stability and income of a balanced or income fund than with the volatility of a growth fund.

Telephone Switching

Many mutual fund organizations now have toll-free telephone numbers. These 800 phone numbers enable the funds to deal with shareholders or prospects anywhere in the country. For the no-loads they provide a human voice to handle many duties that were once the sole province of the mutual fund salesperson.

So, it is now possible for mutual fund investors to buy and sell mutual funds by telephone as easily as they can call their brokers to buy and sell stocks, with several advantages:

1. Switching no-load funds, there are no transaction costs.
2. Funds switched to a money market fund start earning interest immediately. It is often slower and less convenient to put the proceeds from the sale of a stock into interest-earning securities.
3. With fund switching, there is no need for stock selection, a benefit to those investors who want good diversification.

Redemption Procedures

Traditionally, it has been easy to buy, but a relatively cumbersome and time-consuming process to redeem, fund shares. The usual procedure to sell a no-load fund is first to read the prospectus to determine the individual fund's procedure for selling. Then a letter must be written requesting redemption. This letter almost always needs a signature guarantee, entailing a trip to the investor's bank.

Then, once the letter is mailed, it takes at least one day before the fund or the custodian receives the letter, depending on the investor's location, the fund's location and the mood of the post office. Finally, the custodian bank legally has seven days before it is required to mail the proceeds to the investor. They usually do it in somewhat less time, but overall it is common for one to two weeks to elapse from the time of the initial sell decision until the investor receives the proceeds.

Redemption by check is offered by virtually all money market funds and a few other funds. Checking privileges and policies vary from fund to fund but basically the check redemption feature allows you to withdraw your money by simply writing a check equal to or exceeding the minimum check amount indicated. In effect,

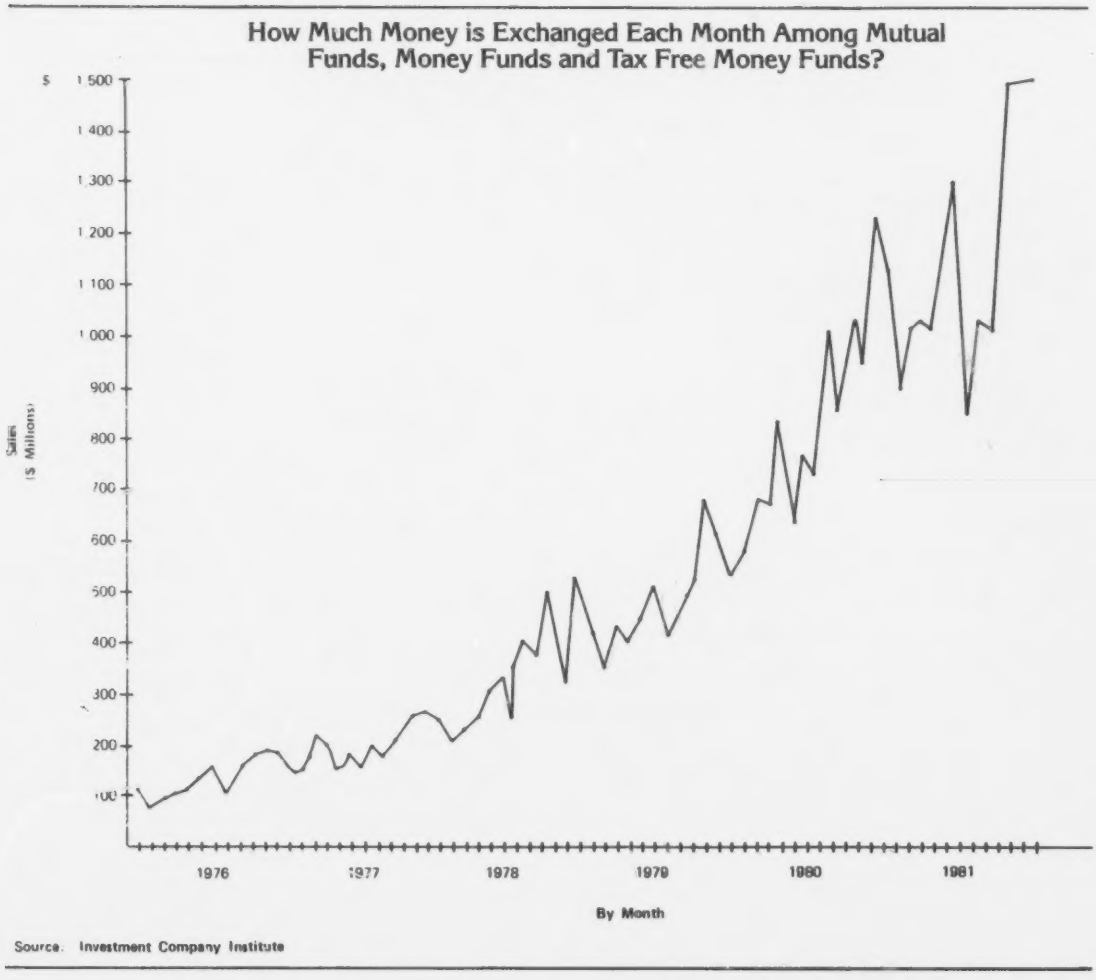

Figure 6. The use of the exchange privilege offered by many mutual fund management companies has grown to the point where mutual fund assets "turn over" many times a year. The availability of money market funds has allowed equity investors to "park" their funds while they wait out declines in stock prices. Features offered by many fund management companies such as toll-free telephone numbers and no or low-cost switching fees have made mutual fund investing attractive to investors who are active managers of their money.

these are the same as any bank check, drawn against an account the fund sets up for you. These checks may be drawn to a third party and can be used to pay bills over the minimum check amount. Usually the funds offer some confirmation of check transactions.

Judging from industry statistics, conversions—including the conventional exchange privilege as well as the new telephone switching—have become an important aspect of mutual fund investing. According to the Investment Company Institute, in 1981 more than

$13.5 billion was shifted from one fund to another within the same fund groups, a 35% increase over 1980. The magnitude of these conversions surely documents the increased sophistication of mutual fund investors.

However, while telephone switching has attracted lots of new investors and lots of new money to no-loads, it is something less than an unalloyed benefit for the funds. They must keep reserves on hand to meet redemptions that can run at high levels at the worst times. Sometimes their carefully laid timing plans go astray because of investors utilizing their telephone switching privileges.

These investors, if they are savvy, will redeem just as a decline in the market is getting underway and reenter just as stocks are moving upward. Thus, if a fund is astute enough to develop a large cash position in correct anticipation of a decline, these reserves can quickly melt away in the face of the switcher's redemptions. The fund may inadvertently find itself fully invested in a declining market. Worse yet, if the fund was fully invested, it would have to sell stocks as prices eroded.

In the steep October 1978 market decline, many investors redeemed the ultravolatile 44 Wall Street Fund. Rather than sell stocks to meet these redemptions, the fund raised its leverage position to 30%. Then the market turned around on November 1 after President Carter took steps to defend the dollar. The fund gained 18.4% in a single day, possibly a mutual fund record!

Conversely, a fund would like to be fully invested at the beginning of an upturn. While they always welcome new money, if it pours in as the market is rising, putting it to work quickly is a difficult task. Bargains disappear quickly in an up market.

Redemption Fees

While no-load mutual funds have no "entrance" fee, a few do have "exit" fees or, more properly, redemption fees. In most cases these redemption fees are levied to keep investors from taking advantage of the no-load's marketing structure by "trading" them. All payments and withdrawals involve administrative costs and the possibility of bad checks.

While a 1% charge is the most popular level, a few funds go as high as 2%. Many funds apply the redemption charge only on shares held less than six months or a year; thereafter, the shares can be sold without penalty. The *Almanac* recommends you not avoid a specific fund simply because it has a redemption fee. After all, it's less than the commission charged for many stock transactions.

5. How to Choose the Mutual Fund That's Right For You

How do you make an intelligent selection from the wide array of mutual funds? When you scan the list of mutual funds, the problem might seem overwhelming. But the process becomes a great deal easier once your own goals for fund investment are analyzed. Then it becomes a clear-cut case of finding the proper category of funds. You can zero in on specific funds in that category and investigate their investment objectives and policies. The fund categories below are ranked in descending order of safety and are described in the following sections:

1. Money Market Funds (the most popular type of mutual fund)
2. Bond Funds
3. Income Funds
4. Balanced Funds
5. Growth and Income Funds
6. Growth Funds—
   Long-term Growth Funds
   Performance Funds
   Hedge Funds

Let's look at the objectives of the various types of funds to see which are suitable for you.

Money Market Mutual Funds: Cashing In on High Interest Rates

Money market funds are similar to mutual funds that invest in stocks or bonds, but instead of buying stocks or bonds, money market funds buy short-term money market instruments. These include bank certificates of deposit, bankers' acceptances, commercial paper, U.S. Treasury bills and notes, and U.S. government agency securities and evidences of debt.

- ☐ The concept of the money market fund was put to work in November 1972 with the establishment of the Reserve Fund—which began with total assets of $100,000.
- ☐ The money market funds boomed when interest rates went sky high during the 1974–1975 hyperinflationary period. At that time, thousands of investors took advantage of 10% or better yields.
- ☐ The money market funds prospered in 1976 and early 1977 even though rates during this period were no higher than insured bank accounts because large investors, often institutions or businesses, found money market funds to be ideal cash management vehicles. For many, the alternative for excess cash would be a non-interest-bearing checking account. Most funds today grant check writing privileges, providing in effect an interest-paying checking account.
- ☐ Short-term rates pushed higher in the latter part of 1977 and have stayed at high levels since. In this investment climate, money market fund assets zoomed. By the end of 1981 they had soared to $181 billion.

There are three main classes of money market funds that differ primarily in the services they offer to particular market segments:

1. *General purpose*, usually sponsored by mutual fund organizations or formed by independent investment companies organized primarily to sponsor a money fund.
2. *Stockbroker-affiliated general purpose*, a substitute for free credit balances in the brokerage firms. Nowadays if an investor sells a stock, his broker will recommend the money be transferred to the firm's money market fund until such time as a new equity purchase is made. The brokerage firm handles the paper work, and in many cases money fund balances and transactions appear on the firm's monthly statement.

3. *Institutions-only* funds, used primarily by bank trust departments and pension funds—those shareholders requiring institutional services such as sub-accounting. Institutions-only funds do not usually offer checking.

At year-end 1981, the general purpose funds had more than $55 billion in assets, the stockbroker-affiliated funds had more than $94 billion and the institutions had only $32 billion, for a total of $181 billion.

Bond Funds

Income is the primary objective of bond funds. Since bond prices fluctuate with changing interest rates—prices fall as rates rise—there is some risk involved despite their conservative nature. In the present period of volatile interest rates, bond funds are a way of insuring your own portfolio. Should interest rates fall dramatically, the value of bond fund investments will skyrocket, offsetting money market losses.

- ☐ In 1974 declining bond prices reduced the bond funds' total return—changes in asset values plus dividends—even though interest yields were at a very high level.

For example, the no-load Northeast Investors Trust, holding mostly corporate debentures, declined 7.5% because of falling bond prices, even though the fund's yield was a high 9.4%. On the other hand, when interest rates declined in 1975, Northeast's total return rose dramatically to 17.2%, including 9.1% from income.

There are two significant advantages to buying bond funds rather than buying bonds directly:

1. The bond fund is more liquid. It can always be sold at net asset value, while the small investor may incur deep discounts from the round-lot bond price if he sells less than $100,000 of a typical issue.
2. As with stocks, there is the advantage of diversification. Bonds and their interest payout aren't always guaranteed, as some Penn Central bond holders found out. Yields can often be improved since diversification spreads risk. The fund can hold lower grades of bonds with greater returns than you as an individual might care to own.

Bond funds are not all the same. Some specialize in buying high-grade bonds, others in low-grade corporate debentures, a more speculative form of investment. For example, the Keystone Group has three separate bond funds ranging from its most conservative Investment Bond Fund to the Keystone Discount Bond Fund, which involves riskier issues and foreign issues with wider price fluctuations.

These funds offering low grade, high yielding bonds are colloquially termed "junk bond" funds. They have become quite popular and many new ones have been organized.

A few funds specialize in convertible debentures (including dividend-paying convertible preferred stocks). Convertibles are securities that can be exchanged for the common stock of the issuing company. These funds can resist downtrends because their interest income cushions prices, while the conversion potential permits them to participate in bull markets.

Income Funds

These funds are specifically designed to produce the highest dividends—of primary importance to investors who need liberal current income and don't expect to see much in the way of capital gains.

Income funds can be grouped into two subcategories. About half are flexibly diversified, which means they hold varying proportions of common stocks, preferred stocks, and bonds. In 1981, the average dividend yield of flexibly diversified funds was 9.72%. The other half hold primarily bonds. Their average dividend yield in 1981 was 13.61%.

Balanced Funds

The balanced fund has a conservative investment policy. It attempts to minimize risk by investing a substantial portion of its assets (25–40%) in so-called senior securities—bonds and preferred

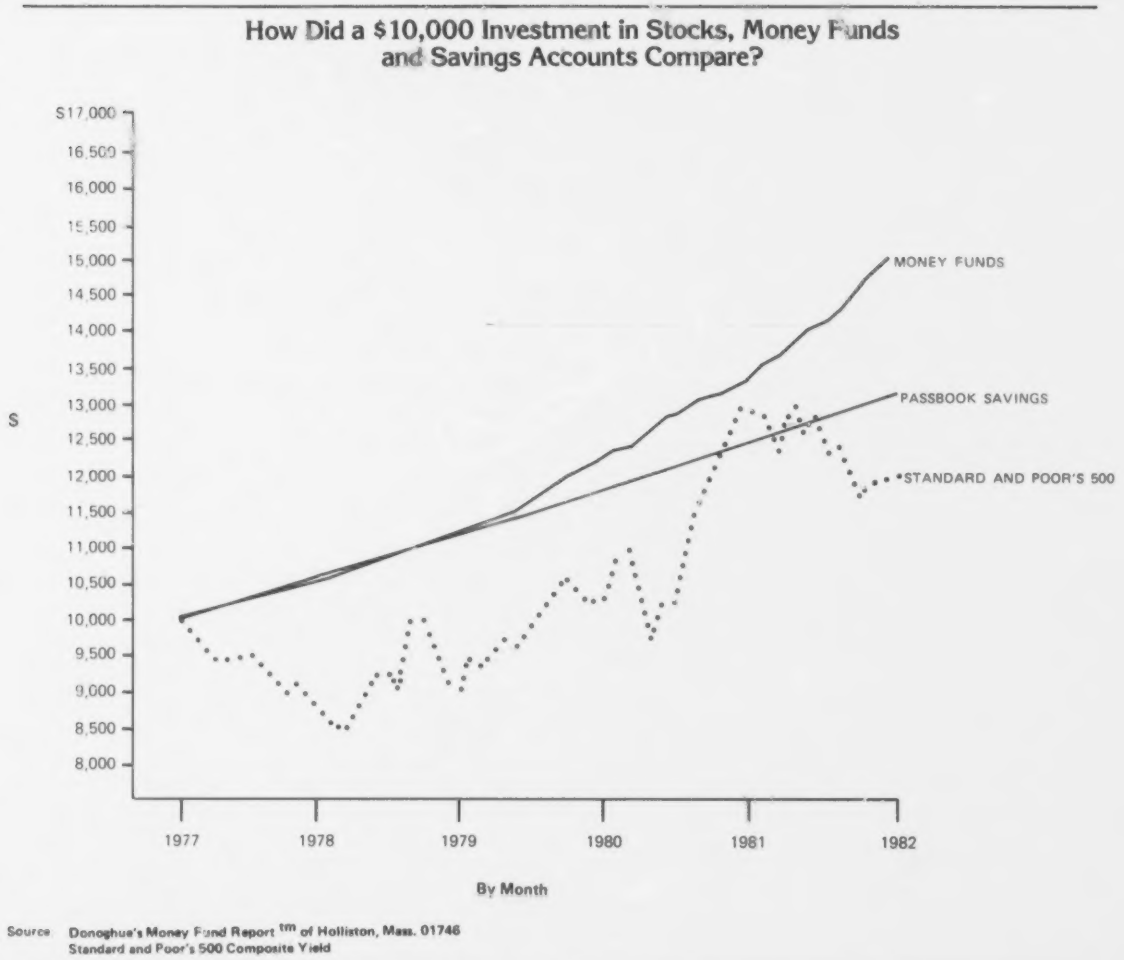

Figure 7. Because of the high interest rates in the late 1970s and early 1980s, the return on money market instruments has outperformed equities. High interest rates have depressed stock prices, yet dividend yields are increasing. This paradox can be explained by "discounting"—a process of equating future returns to present values. Just as money grows faster the higher the interest rate at which it is compounded, it is equally true that a dollar of future income is worth less today the higher the interest rate at which it is discounted. Since common stocks promise most of their return (dividends plus capital gains) in the future, and future income is worth less in a higher interest rate environment, investors have drastically lowered the price they are willing to pay today to achieve these future gains. However, should interest rates fall, future income will be worth more in the present and there will be a corresponding rise in equity prices.

stocks. A balanced fund can provide both long-term capital appreciation and income.

Years ago, the balanced funds were the stars of the mutual fund business and enjoyed a

healthy market share. While now only a small percentage of funds are balanced, they include two of the largest non-money market funds—the $1 billion Investors Mutual and the $500 million Wellington Fund. These two alone account for over 8% of the assets of the entire mutual fund industry (excluding money market funds).

There are about 20 balanced funds of any consequence and most of them were in existence before 1940. These funds reflect the economic climate of the 1930s when portfolio managers were concerned with a company's physical assets and the stability of its income, dividends and yield. Only a handful of new balanced funds have come into being in the past 20 years.

Growth-Income Funds

Growth-income funds invest in common stocks. This type of fund not only seeks capital gains, it also looks for stocks that pay dividends. Such funds state clearly in their prospectuses that they seek stable income as well as gains. They *will* follow the market, whether up or down.

Growth-income funds are very suitable for conservative investors. They offer greater stability and will not fluctuate in value nearly as widely as the speculative performance funds, particularly in down markets. This group includes the oldest mutual fund in the country, the Massachusetts Investors Trust, which began operation in 1924. Other billionaire members of this group of funds are Affiliated Fund, Investors Stock Fund and The Investment Company of America.

Growth Funds

The growth fund emphasizes the production of capital gains rather than current income. Growth funds now constitute the largest category of mutual funds. Presently, there are more than 200.

Growth funds aren't all the same and any classifications are somewhat arbitrary. However, for purposes of explanation, we have divided them into three categories: long-term growth funds, performance funds and hedge funds.

Long-Term Growth Funds

Long-term growth funds are often referred to as middle-of-the-road funds, diversified common stock funds, quality growth funds or simply growth funds.

Over the long run, these funds, by emphasizing stocks of companies and industries with the greatest long-term growth potential, have fared well. They are ideal for the long-term investor seeking to keep abreast of inflation. Typically, growth funds are best suited to the needs of younger investors willing to assume some risk in the hope of building greater future equity.

Performance Funds

These speculative funds are also called "go-go" or maximum capital gains funds designed to take greater risks for greater possible gains. Even today, the top-ranked funds are often performance funds—usually small ones, under $100 million in assets. Performance funds often buy stocks of small unseasoned companies, stocks with relatively high P/E multiples and stocks whose prices are volatile. Some performance funds employ leverage—that is, they buy stocks on margin by borrowing.

Despite their speculative character, performance funds are a good way for the sophisticated investor to participate in high-potential investments. Since risk is diversified, a sharp decline in one or two stocks is not a catastrophe.

Performance funds are the most volatile of all funds. When you buy a performance fund, you can expect greater gains in good markets. On the other hand, be prepared for greater losses in bad markets. In 1971 the no-load performance fund Nicholas Strong was up 85.5%, the number one fund that year. In 1972 Nicholas Strong grew 28.1% and ranked 18th among all funds. In 1973 and 1974, the stock market declined and Nicholas Strong, as expected, declined at a far greater rate than the market. It was off 68.6% in the two bear market years. In 1974, one of the founders, Strong, left and the fund was renamed the Nicho-

las Fund. The fund then had outstanding gains in 1975 through 1980. At the end of 1978 it was still 14% behind its December 1972 level. A strong performance in 1979 finally put it ahead of its level seven years before!

If you wish to invest in performance funds, you should consider selling them if you feel a bear market looms. Otherwise, you will be the unwitting victim of what mutual fund author A.M. Watkins has termed the "super-loss" factor. Sharp losses suffered by volatile mutual funds or stocks can impose a special handicap on an investor because of a unique statistical quirk of which many investors are unaware.

Gain and loss figures work out so that a percentage loss in an investment must be followed by a percentage rebound greater than the loss just to bring you back even again. For example, a fund that declines 20% must come back 25% just to make you even. A sharper 50% loss requires a 100% rebound for you to regain your initial capital! Figure 7 illustrates the rise needed to break even after various declines.

Hedge Funds

A hedge fund is a variation on the performance fund concept seeking strong appreciation but attempting to minimize volatility by cashing in on the fact that while certain stocks are going up, other stocks are going down. The term is also used to denote any aggressively managed high risk fund. The hedge fund management not only tries to pick the winners, it also bets on the losers, selling "short" the stocks the management believes will go down.

In a short sale, the investor borrows shares from a brokerage house and sells them, hoping that the market price for the shares will drop. If this happens, the investor buys shares to replace those he borrowed and the difference between the price he sold the borrowed shares at and what he has to pay for the replacement shares is profit—less commission, of course.

6. Specialized Mutual Funds

Special-Purpose Funds

Individual Industries

If you are in insurance broker or banker and know your industry well, you might want to invest in a mutual fund which specializes in your industry. There are a dozen or so industry funds available. Insurance industry funds include Century Shares Trust and Life Insurance Investors. The Franklin Custodian Funds' Utilities Series seeks out the best in the utilities field. The Chemical Fund has a long and distinguished record of investing in companies involved in some form of chemistry. "Gold-bugs" can consider ASA, Ltd., Golconda Investors, International Investors, Research Capital or United Services.

The industry funds can be grouped into two categories: Those heavily concentrated in their industry and those whose name perhaps suggests more of a concept than true specialization. The Bank Stock Fund is an example of the former; the Chemical Fund is an example of the latter. The fund's prospectus now permits investments in companies engaged in the chemical, chemical process, and *related* scientific fields. Related fields include drugs, nutritional products, toiletries and cosmetics, computers and computer software, paper, fertilizer and seeds, minerals, office and petroleum products.

A few years ago a half-dozen new funds emerged to seek investments that furthered specific social programs. Their goal was to provide sound investments for churches, universities and individuals wishing to combine their ideals with their financial programs.

For example, The Dreyfus Third Century Fund seeks growth and income by investing in companies which, in the opinion of management, not only meet traditional investment standards, but also contribute to the enhancement of life in America as the nation enters the third century of its existence. Another social responsibility fund, Pax World, has much the same criteria [illegible] addition does not invest in companies engaged in military activities. Foursquare Fund, managed by the Eaton & Howard group, does not invest in those companies which derive substantial portions of their earnings from the manufacturing, distribution, or sale of alcoholic beverages, tobacco, or drugs.

The social fund investment policies are not necessarily a bar to good performance. Dreyfus Third Century has been in the upper 10% of all funds the past five years.

Multifunds own portfolios composed of other mutual funds. A relatively recent development, they offer a diverse selection of both load and no-load funds chosen by professionals trained to evaluate mutual funds. When multifunds buy load funds, their shareowners benefit because multifunds usually pay lower commission rates than individual investors pay. On the other hand, management fees will run higher; the investor pays twice, once to the management of the portfolio funds and again to the management of the multifund. The Lowry Fund is the only multifund in the 1982 *Almanac*. It specializes in market timing.

Municipal Bond Funds

In April 1976, a new type of mutual fund was born. The Kemper Municipal Bond Fund became the first fund to provide both continuous professional management and tax-free income. A few months later, the Fidelity Municipal Bond Fund became the first no-load fund investing in municipal bonds. Both funds were limited partnerships end-running the then existing law which prevented mutual funds organized as corporations from distributing tax-exempt income to their shareholders.

Shortly thereafter, there was a major breakthrough. The Tax Reform Act of 1976 permitted,

for the first time, investment companies organized as corporations to pass along the benefits of tax-free income. With this new flexibility, many of the fund industry's best-known names rushed to bring out municipal bond-funds. Middle- and upper-income investors responded eagerly because they now find themselves in tax brackets in which tax-free income can be utilized to good advantage.

These funds are similar to, yet different in many respects from, the unit trusts that have long been available. The unit trusts are fixed, self-liquidating, non-managed portfolios of municipal securities while the funds are fully managed. Each investment vehicle has its advantages and its disadvantages. Both the funds and the trusts provide important diversification, custodianship, coupon clipping and record-keeping services. Both provide periodic reports and interest checks to shareholders. The main differences are in the rate of return, degree of liquidity, sales charges and management fees, reinvestment of dividends, ease of investment and presence of management.

Liquidity. The mutual funds are unquestionably more liquid, particularly the no-loads. Mutual funds will redeem shares, free of charge, allowing the investor to move in and out of the fund. If shares appreciate, the fund investor can easily take his capital gain. Many funds also offer an exchange privilege allowing investors to transfer money into other types of funds within the same management group. In contrast, the trusts, because there is a 3½ to 4½% sales charge, are designed for the longer-term investor. However, the trusts do have a secondary market where units may be sold without charge. If a secondary market is not maintained, the holder can redeem his holdings with the trustee. Load mutual funds are quite similar in character to the trusts because the sales charge, from 3.60% to 4.75% discourages in-and-out trading in the early years. Load funds still are more liquid than the trusts if they are part of a group offering an exchange privilege

The Effect of Charges on Return. The trusts have few expenses beyond their initial sales charge. There are no management fees and the trustee's and evaluator's fees are about .14% annually. This contrasts sharply to the mutual funds whose maximum operating expense ratios run from .75% to 1% or more. This means that over the long run, after their sales charges are amortized, the trusts can offer a higher rate of return. In addition, this rate of return is essentially fixed; the investor knows from the beginning what it will be. With a trust, it is easy to "lock in" a high yield. In contrast, the portfolios and the return on managed mutual funds will vary over time. Moreover, as their bonds are traded, there can be capital gains or losses which have tax consequences.

Where does the breakeven point between a trust and a no-load mutual fund lie? Here is the answer based on a hypothetical trust and no-load fund owning identical portfolios.

Assume an expense ratio of .75% for the fund and .14% for the trust. Then add the trust's 3.5% sales charge (3.627% of money actually invested). It would take about six years for the fund's larger management fee to equal the trust's fees (3.627% divided by the difference between .75% and .14%). In this comparison, if an investor plans to hold more than six years, he would obtain a better overall yield from the trust; under six years the no-load would offer a greater return.

Ownership of a municipal bond trust is clearly more advantageous than ownership of a load mutual fund because both have initial sales charges, while the trust has no management fee. The exception would be if an investor planned to switch to a common stock or money market fund in the same load fund group. However, since there are no-load groups offering similar exchange privileges, there is no necessity to buy a load municipal bond fund for this reason.

In our illustration, we assumed identical portfolios for ease of computation. Of course, portfolios do vary. One structural difference is that the funds planning to buy and sell their bonds when the occasion demands, concentrate

their holdings among more actively traded issues than the trusts in order to minimize transaction expenses. The trusts can buy inactively traded bonds which command a yield premium. On the other hand, the funds' ability to manage their portfolios *may* make up for this benefit the trusts have. The trusts have been burdened with souring bonds they are unable to sell off. During 1974's interest rate crunch, some trusts, offered originally in the low-interest 1960s, lost a third of their value.

For you to determine how a specific fund compares to a specific trust, first see if their portfolios are of roughly equal quality. If they are by and large the same, subtract the fund's current yield from the trust's current yield. Multiply this difference by the number of years you plan to hold. If the result is less than the trust's sales charge, buy the fund; if not, buy the trust. If the portfolios differ significantly, a penalty must be applied against the riskier portfolio. This is a rough estimate which gives no credit for the fund's management ability.

The mutual funds have two ways of exercising management ability. Generally speaking, the funds will 1) endeavor to exchange existing bonds for more attractive ones, and 2) to move defensively, selling off a portion (seldom more than 20%) of the portfolio if they anticipate that movements in the general level of interest rates will adversely affect bond prices.

Another advantage the trusts have is that they are always fully invested, whereas the funds must keep a certain amount of cash on hand to meet possible redemptions. The funds' prospectuses generally state they can keep 10% to 20% of their assets in short-term money market instruments paying what may be a lower rate of interest—and taxable to boot.

Reinvestment Privileges. The funds have other advantages. Most important is the privilege of reinvestment of dividends. Many investors in tax brackets that make municipal bonds desirable do not need current income. The dividends from the trust often dribble in monthly in small amounts. For example, one Municipal Investment Fund pays $5.56 monthly per thousand dollars of face value. It will take a while to accumulate enough dividends to reinvest in other trusts. The funds have the capability of reinvesting tax free income so that it compounds to produce more income tax free. Monthly compounding in a mutual fund can increase a 5.7% return to 5.90%.

Recognizing this major liability, the Nuveen Corporation, which pioneered the trusts, now permits their investors to reinvest their interest payments into a load mutual-fund. No sales charge is paid for the reinvestment privilege. Similarly, Merrill Lynch now permits Municipal Investment Trust investors to reinvest without charge into a special open-end fund.

A Safe Investment. Notwithstanding New York City's well publicized problems, municipal bonds are a safe investment. The total dollar volume in municipal bond defaults from 1945 through 1975 was about $500 million, with $334 million represented by three large revenue bond issues. The $500 million is only about one-quarter of one percent of all municipal bonds outstanding as of the beginning of 1975. By way of comparison, in the 1970s the collapse of the Penn Central and other major failures led to an estimated $1.3 billion in defaults in corporate bonds through 1975.

How to Select a Municipal Bond Fund. The appeal of municipal bonds is directly related to your tax bracket; the higher the bracket, the greater the effective rate of return. The table below should help you decide if you can benefit from tax-free income.

Additionally, realize that with municipal bond funds, only federal income tax is excused; most state taxes must still be paid.

If you decide the open-end municipal bond fund is most advantageous for you personally, here are guidelines to enable you to select the best municipal bond funds.

1. Buy *no-loads*, the sales commission for a load fund is the equivalent of nearly a year's interest.

2. Look for the *lowest management fees* and lowest maximum expense ratio. Expense ratios are relatively unimportant with common stock funds, but are most important for bond funds since expenses are subtracted directly from your yield. The management fee is usually a fixed percentage of total assets.
3. *Buy a large fund.* Large funds, say $100 million or more in total assets, will generally have lower expense ratios than small funds. Large funds could also have more buying muscle in the secondary markets and have more flexibility in diversifying their portfolios.
4. *Management ability* is unquestionably important but hard to determine. The prospectus may give some indication. Performance often tells the story. Management skill is needed to make good bond selections and to capitalize on market fluctuations.
5. *What is the risk?* Some funds are buying conservative lower yielding bonds. Others, higher yielding more speculative bonds. You can get an indication of their policy from the prospectus. Bonds are often rated by grades although this is far from an absolute indication of their quality. Most funds use either Standard & Poor's or Moody's rating system. S&P rates the best quality, "prime" bonds, AAA. The next lower rating, still a "high grade" is AA. "Good grade" are A and "medium grade" bonds are BBB. Moody's has similar ratings: Aaa, Aa, A and Baa.

   The prospectus will state the fund plans to hold only bonds BBB or better, or 80% A or better, etc. The greater the proportion of bonds with the highest ratings, the more conservative the portfolio. Many funds are also permitted to purchase some unrated bonds that they believe have the investment characteristics of bonds in the top three of four rating categories. It is when they select unrated bonds that the funds best demonstrate their superior professional expertise. All funds indicate they will hold some monies in short term securities, usually taxable, for various reasons including defensive ones, i.e., "due to market conditions" or "in anticipation of a decline in the value of portfolio securities."
6. Check *secondary benefits.* Various funds offer expedited redemptions including check writing, daily declaration and compounding of interest and reinvestment, withdrawal accounts and switching to other funds in the same group.

   Municipal bond funds and money market funds have both been so successful that sooner or later someone had to decide to combine the two. Several someones have. The result is the short-term tax exempt mutual fund. There are now a number available to the public.

Closed-End Funds

Closed-end funds issue a fixed number of shares at the time of the initial offering and rarely change the number outstanding.

If you choose to buy shares in an existing closed-end fund, you have to buy them on the open market from someone who presently owns them and wishes to sell. Most of the closed-end funds which are also known as investment companies are traded on the NYSE. Instead of the sales charge common to most of the mutual funds, you will pay a commission figured on the same basis as the commission payable on any other shares traded on the Exchange.

The major similarity between mutual funds and closed-end funds is that each seeks to limit the risk of their shareholders by diversifying holdings in a number of different securities.

A major advantage closed-end funds enjoy is that, with a fixed number of shares, they do not have to worry about redemptions. But this feature can also work against them. By the same token, they do not enjoy the advantages of new money inflow which many fund experts maintain enables the open-end funds to achieve better performance.

Table 6–1 Find your taxable income and read across

Taxable income		Tax	To equal a tax-free yield of:			
Joint return	Single return	Bracket	6%	7%	8%	9%
			a taxable investment would have to earn:			
$ 20,200- 24,600		28%	8.33%	9.72%	11.11%	12.50%
	$ 15,000- 18,200	30%	8.57	10.00	11.43	12.86

Dual-Purpose Funds

Dual-purpose funds are a type of closed-end fund. These funds operate on the principle that many investors seek the security of steady income, while others seek out the riskier but potentially more rewarding avenue of capital gains. The dual-purpose funds bring these two investor types together, pooling their money in such a way that the income-seeking investors receive all the income from the entire pool, and the capital gains.

Capital shareholders are credited with whatever capital gains the entire fund-pool makes, but they also have to withstand all its capital losses.

Both the income and capital shares may sell at a substantial discount from their net asset value. In effect, this means the purchaser gets a free asset bonus—though the discount may persist, or even have widened, when he goes to sell his shares. While the income shares sell on the basis of their yield, the value of the capital shares fluctuates considerably, because of their 2-for-1 nature.

The income shares can be considered preferred stocks. They have a stated minumum dividend that is cumulative. They are callable after a stated number of years. (The 1982 *Almanac* statistical section lists redemption dates.)

Redemption provisions can vary from fund to fund. Since all funds have redemption dates between now and 1985, it would be wise to contact the fund for its prospectus before attempting to buy.

7. Tax Considerations for Mutual Fund Investors

Each year some mutual fund investors incur tax liabilities that could have been avoided by a better understanding of the nature of dividend and capital gains distributions and the tax liability involved.

Dividends are earnings that a corporation pays out to its shareholders. The distribution represents a share in the company's profits. Dividends are taxable at 100% based on the shareholder's tax bracket. In contrast, a capital gain arises from the sale of an asset that has been owned for one year or more. The profit from the sale of securities that have been in your fund for more than a year are taxed at 40% of your tax bracket. For example, if you are in the 50% tax bracket you would pay only .40 × .50, or 20% tax on your capital gains.

Most investors receive, some time during the year, either a check or a notice that their account has been credited. This payment is identified as dividend income or a capital gains distribution. But these distributions don't benefit the shareowner. Here's why.

Let's say a fund, over the year, has accumulated dividends of 25 cents a share and realized capital gains of 75 cents a share, a total of $1.

Since funds enjoy a tax advantage if they act as conduits by distributing at least 90% of these dividends, they will generally do so. In this way, the distributions aren't taxed twice; only the shareholder pays. (In contrast, corporate profits are taxed at two levels: Once as corporate earnings and again when dividends are paid to shareholders.)

Let's assume it's now time for the fund to distribute *profits* (i.e. makes a distribution to shareholders of record). The fund is selling at $10 a share. it goes ex-dividend and, since funds are always priced at net asset value, the per share price immediately drops to $9. The investor will then receive a check for $1 per share of distributions or, if he is reinvesting, a notice that his account has been credited with additional shares.

In either case, the sum of the current value ($9) plus the distributions still equals $10. The distributions have not provided any real benefit to either new or existing shareholders; only a tax liability has been incurred.

The example holds true whether you receive these distributions in cash or have only a reinvestment slip to show. In both cases, the fund will send a copy of the distribution notices to the IRS, which will then collect taxes on these profits.

The long-term shareholders of the fund in our example should rightfully pay tax on these distributions because they shared in the growth that made them possible. But a shareholder who bought shortly before the distribution was declared has only the tax liabiiity. The only way to avoid tax liability is through timing of purchases. It will seldom be avoided completely, since the investor has no way of knowing how much, at any given time, a fund has accumulated in its dividend account, or how much realized capital gain is waiting to be distributed. But it can be minimized by not purchasing shares immediately before a fund goes ex-dividend.

How do you know when that's going to happen? Brokers and dealers are under instruction from both the SEC and the National Association of Securities Dealers (NASD) that it is improper to sell fund shares to a customer when they know a distribution is imminent. Most of them are conscientious about keeping track of the distribution dates of funds they handle, and will advise you to postpone a purchase if it's to your advantage. Occasionally, however, a fund is less cooperative

than it might be in making the information available.

If you're buying a no-load fund, you'll have to dig out the information the same way a broker-dealer does: from the prospectus or reports of the funds, or by direct inquiry to the fund.

Dividends are paid whenever it suits the convenience of the individual fund, and dates are often unpredictable. Capital gains distributions are generally made at the end or beginning of a year in the period from November to February.

Dividends may be paid annually, semiannually, or quarterly. The trend among performance funds—where dividends are small—has been toward yearly payouts at the same time as the capital gains are distributed.

Tax consequences may also affect the timing of a sale of fund shares. If you're an investor who receives more than $100 a year in dividends, you might consider selling just before an income distribution. In this way, the dividend income is converted into a capital gains distribution instead of being taxed at ordinary rates. Providing the fund has been held one year, it is then taxed at the lower long-term rates.

Tax tip: Don't forget that both dividends and capital gains distributions, when automatically reinvested, become part of your cost. For tax purposes, it's as if the fund had sent you checks for amounts due you, and you cashed the checks and then took the money out of your pocket to buy additional shares.

Here, for example, is one mutual fund's illustration of the 10-year results of an assumed investment of $10,000:

Value of shares initially purchased	$26,872
Value of shares acquired by reinvestment of dividends	5,720
Value of shares acquired by reinvestment of capital gains	5,100
TOTAL VALUE OF INVESTMENT AFTER TEN YEARS	$37,692

While the only money this hypothetical investor actually took out of his pocket during the ten years was the initial $10,000, if he now wished to redeem his shares he should list as his cost:

Initial investment	$10,000
Dividends used to purchase shares	3,048
Capital gains distributions used to purchase shares	4,052
	$17,100

Thus, although his original investment of $10,000 is now larger by $27,692, the capital gain he has to report for tax purposes is only $20,592—the $37,692 realized on the redemption, less the $17,100 total cost of the shares.

A little known mutual fund tax break: In a bear market, smart mutual fund managers often take their losses—to get out of the market or for tax benefits. In the aftermath of the 1973-74 bear market, losses were often sizeable. When a fund has net *realized* tax losses, it doesn't have to distribute capital gains profits until its losses are fully offset. And because the IRS permits these losses to be carried forward for five years, 1974's losses were absorbed through 1979. Investors benefit since they don't have to pay any capital gains tax (unless, of course, they sell their shares at a profit).

It is amazing how many investors do not understand the tax consequences of distributions, how many investors still believe it is of real benefit to receive a distribution.

Several Anchor group funds had realized tax losses from the 1973-1974 bear market. Thus, to distribute capital gains earned in 1976 and 1977 would have meant their shareholders would pay unnecessary taxes since these gains would have been laid off against the tax loss carryover.

But many Anchor shareholders demanded a distribution. (Not understanding the consequences, they thought that no distribution meant the funds had not produced any gains for them.)

In order to satisfy these shareholders, and still not incur any tax penalty for them, the Anchor management decided to declare a stock dividend.

Now the long-term benefit of a stock dividend is often of arguable value even for corporate stock. In the case of a mutual fund, always priced at net asset value, it is a completely meaningless exercise. The price of the fund must immediately drop by the same exact percentage as the distribution.

The Anchor people, of course, knew this. Nevertheless, in 1976 four funds declared 3% to 4% stock dividends and in 1977 Anchor Income declared a 2% stock dividend. The result: Certain naive shareholders were kept contented; no tax liability was incurred. While our hats are off to the Anchor management, don't be a shareholder who needs gains distributed.

Tax Shelter Options for the Mutual Fund Investor

For many, there are pension plans to supplement social security income. For civil service employees, pensions contribute significantly to retirement. For the person who toils in the private sector, pensions may or may not be adequate. At present, private pension plans are far from universal, and lack mobility. If you change jobs you will, most likely, lose your pension rights. In fact, a book by Ralph Nader and Kate Blackwell, *You and Your Pension*, estimates that at least *half* of the 34 million Americans now enrolled in these private pension plans *will never receive a penny*!

The Employee Retirement Income Security Act of 1974 was created to close the gap in private pension coverage. It has expanded tax-shelter options for millions, and for some it opens up the possibility of the ultimate goal: to retire at 100% of salary. ERISA covers four major areas—an expanded Keogh plan, an Individual Retirement Account, corporate retirement plans and annuity plans. Here are highlights for the mutual fund investor.

Keogh Plans—A Double-Barreled Tax Break for the Self-Employed

A Keogh plan is a retirement plan designed for self-employed individuals. Named after one-time Brooklyn Congressman Eugene Keogh who sponsored the original legislation in 1962, it consists of tax deductible contributions and tax-sheltered accumulations of income and capital gains.

With a Keogh plan, you get an immediate tax deduction for the money you set aside for yourself each year in an investment fund. Now because of the new regulations of the Economic Tax Recovery Act of 1981 you can set aside 15% of self-employed earned income or $15,000 per year, whichever is less. All the earnings and profits on the plan's investments are allowed to accumulate year after year completely tax-free—you pay no taxes until you receive benefit payments on retirement. In addition to this double-barreled tax break, if you eventually withdraw your benefits in a lump sum, the payout will be accorded favorable tax treatment.

Once you start a plan, the money you set aside cannot be touched until you reach retirement years—which cannot be earlier than age 59½ (except in case of death or disability). If money is withdrawn prematurely, there are severe tax penalties. Furthermore, withdrawals must begin before the age of 70½.

If you have full-time employees—people who have been working for you three years or more—you must include them in your Keogh plan. But if your employee is your spouse this can be advantageous.

In some instances, there is another plus. If your plan covers another participant who does not own more than 10% of your business, you can make an additional voluntary contribution *over and above the $15,000 maximum*—up to 10% of yearly earned income or a maximum of $2,500, whichever is less. While this sum is not tax-deductible, all earnings on this voluntary contribution are tax-sheltered.

There are breaks for moonlighters too—call it a "mini-Keogh." If your total adjusted gross income is less than $15,000, you may contribute 100% of your self-employed income or $750, whichever is less. This provision is designed for the self-employed person with modest earnings

who would have a severely limited tax deduction under the general Keogh provisions. For example, the tutor or neighborhood piano teacher who earns $2,000 annually would otherwise contribute only the maximum 15% of yearly earned income, in this case $300. Remember: If you top the $15,000 limitation on total income by even a dollar, your deduction is cut back to 15%

Advice for high-income investors: Where in past years you took risks to achieve the tax breaks that come with capital gains, you can now achieve these same tax breaks investing in conservative mutual funds through Keogh.

You have a variety of investment choices—mutual funds, a security portfolio held in trust, an annuity, U.S. Treasury retirement bonds, etc. The mutual fund approach has big advantages.

1. Unlike a securities portfolio, which, under the law, must be placed with a bank as a trustee (and in smaller plans, the yearly trustee fee can cancel out your tax savings), with mutual fund shares, the bank need only serve as the custodian of the shares, usually for a nominal fee.
2. You can buy into a family of funds. It then becomes easy to switch from one fund in the group to another. This can be done—often by phone—when your investment objective or the market changes.
3. With funds, it is easy to keep track of your pension investment. Funds utilize a trustee or custodian to handle all paper work, and at least twice a year you are sent a report of the fund's activities.

Studies show that mutual funds are a very popular vehicle for the funding of Keogh plans. More than 400 funds now operate Keogh programs. The Investment Company Institute (the national association for mutual funds) estimates that one out of three Keogh plans in force use mutual fund shares. The Institute's figures indicate that by the end of 1981 there were 306,000 Keogh plans using mutual fund shares with $3.8 billion in assets under management.

To determine how much you can save under a Keogh plan, take 15% of your self-employed income, and multiply this figure by your highest tax bracket. The result is your potential savings.

A new Keogh plan must be started by December 31, but only a token contribution need be made. The balance of the contribution and subsequent year contributions can then be made at tax filing time. For most people this means April 15 or later if you receive an extension. At that time, it is easy to determine the exact amount you can contribute. If you're interested in setting up a Keogh, simply write any fund which the Almanac lists as having a Keogh plan. The fund will send you explanations, complete instructions and form.

Individual Retirement Accounts for Employees

Only self-employed persons are eligible for Keogh Plans. But now the Employee Retirement Income Security Act of 1974 permits Americans to participate in a retirement program. Now the Economic Tax Recovery Act of 1981 has increased the amount of tax deductible contributions.

Called individual retirement accounts (IRA's), contributions of the lesser of $2000 or 100% of income, or $4,000 if you are married and file jointly, are now deductible from income each year starting in 1982 and the years following, are now deductible from income each year. Contributions and income will be non-taxable until the accumulated funds are distributed at retirement. In addition, income earned by the plan will be tax-free until paid out. Husbands and wives can set up their own plans, with each deducting the $2,000 maximum.

1. If your spouse is unemployed and has no compensation, your maximum allowable contribution will go from $2000 to $2,250.
2. The total amount of your spousal IRA can be divided into separate accounts or one account. The new tax law allows these options.

3. In addition members of qualified retirement plans, company pension plans, government pension plans or Keogh plans are allowed to start IRA because of the new tax laws.

IRA contributions go into a tax-sheltered program so that all dividends, interest and capital gains are allowed to compound year after year completely tax free. IRA plans can be initiated individually. It is also possible for a corporation not providing its own pension plan to permit its employees to voluntarily participate in such a plan by withholding the voluntary contributions from their employees' paychecks for investment.

Also, under IRA provisions, you now can get a new tax break on lump-sum payouts from a pension or profit-sharing plan when you leave a company. The provision represents Congress' one-shot attempt to achieve some measure of pension portability. Here's how it works:

If an individual leaves his company or the company's pension program is terminated, he can establish an IRA rollover account. All or part of the funds received from the company must be deposited within 60 days in an IRA program. You must do this yourself; your company cannot open the account for you. When this is done, no tax is incurred, and once invested, the funds are tax-sheltered.

Moreover, should the individual join another company and qualify for its pension program, in certain circumstances the IRA account can be reinvested in the new employer's plan.

Good news for IRA participants: The IRS allows you to make your IRA contributions up to the due date (including extensions) for filing your tax return for the tax year for which you are claiming the deduction.

Annuity Plan

In the past, employees of tax-exempt organizations such as schools could receive tax advantages by purchasing annuities through their organization. The employee is allowed to have up to 20% of his compensation deducted annually for this investment. Now, this provision in the laws has been broadened to include a program investing in mutual fund shares (owned by insurance companies only) with the same beneficial tax treatment.

Variable Annuities

Variable annuities offer you market rates of interest while your earnings grow tax free. Like an IRA, when you retire and begin withdrawing income, you'll be in a lower tax bracket. Variable annuities can be used by anyone. They can be included under an IRS qualified retirement plan. However, this would allow you to deduct only your investments into an annuity from your taxes. Variable annuities already offer most of the tax advantages other retirement programs provide, without many of the restrictions. But recent IRS rulings have limited where you can purchase an annuity. You can invest only through insurance companies. Insurance companies can set up separate accounts comprised of a money fund, stock fund and bond fund annuitants are permitted to switch freely among funds in a separate insurance company account.

Other advantages of variable annuities are as follows:

1. You do not need to wait until you are 59½ years old to begin receiving payments or to terminate the annuity.
2. You can add more money to an annuity than you can an IRA or Keogh account.
3. Variable annuities allow you to direct your investments.

You can switch or divide your investments among the funds maintained within the insurance company's separate account. By using market timing you can substantially increase the earnings in your annuity. You can receive high current returns from money funds, or long-term yield from bond funds. With equity funds you have the opportunity to receive long-term growth without paying taxes until you withdraw the money. By taking advantage of falling interest rates you can switch into stock funds and substantially increase

your earnings. When interest rates rise you can move back into money funds.

NOTE: The IRS is examining whether or not insurance companies may hire affiliate investment advisors to manage mutual funds used for variable annuities. At the congressional level, the tax deferral status of these annuities is also under scrutiny. Apparently some members of Congress are concerned that variable annuities are being used as a tax shelter rather than a savings vehicle for retirement. As a result of these actions by the government, the status of variable annuities is in question. Therefore it is important that you read all annuity brochures and prospectuses to see if affiliate advisors are managing the mutual funds of the insurance company before buying a variable annuity. Also consult your tax advisor before investing in these products.

Mutual Fund Payroll Plans

About 240 mutual funds offer payroll deduction plans. These are employee investment programs requiring no corporate contributions. They need only a corporate pension or profit-sharing plan that contains an "employee voluntary contribution" provision; if the company doesn't have this provision, a simple amendment to the plan can incorporate it.

What is the "voluntary contribution"? The IRS permits a corporate retirement plan to offer the voluntary contribution provision to all employees participating in the plan, and the employee can contribute up to 10% of his annual compensation on a voluntary basis.

However, the employee does not receive a tax deduction on his contribution since he is investing "after tax" dollars. Nevertheless, there are substantial tax advantages. The employee receives a tax shelter on his investment; that is, dividends and capital gains are exempt from tax when distributed. Taxes are deferred until the employee receives his benefits—upon retirement or termination of employment. Under this plan, employees usually take their equity in a lump sum, paying a capital gains tax on the growth.

In addition to the tax advantage, there are four other features that strengthen the appeal of these payroll plans:

1. The plans are flexible. Employees can select their own rate of contribution—from 1% to 10% and can can terminate the contribution at any time. However, if you also have an independently owned IRA, the contribution must not exceed the maximum allowable deduction after you have subtracted your voluntary contributions to your company plan.
2. Payment is easy since contributions are deducted from paychecks.
3. The plans are portable. If the employee leaves the corporation, he can take his mutual fund money with him.
4. If the money is invested in load funds, the pooled contributions of all employees are treated by the fund as a single purchase, qualifying for a volume discount and lower sales charges. Letters of intent and rights of accumulation are encouraged.

8. Making the Purchase

Interpreting The Mutual Fund Prospectus

The prospectus is a very useful tool for the mutual fund shareholder, one the investor should learn to utilize since it is designed for his protection. A mutual fund's investment objective and policy is stated in its prospectus, as required by law. The data in a fund prospectus is standardized throughout the industry under SEC regulation and supervision. A prospectus tells you if the fund's management is inexperienced or if the fund is being sued—facts that aren't necessarily forthcoming when you talk to a personal investment counselor or a broker.

And only mutual funds always have a prospectus available. That's because new shares are continually being sold. You don't get a prospectus when you buy stock, unless it is a new issue.

Here are the major sections of a prospectus with a brief explanation of each.

Basic Nature, Objectives and Investment Policy

In Table 2, each fund's objective is listed in one or two words. In the prospectus, it is described in detail. This is important since not all growth funds, or all income funds are alike. Some growth funds invest in established growth companies like Hospital Corp. of America; others buy new companies; still others look for turnaround situations or even go overseas for their investments.

The methods used in attaining these objectives will be listed. This section further explains whether the fund will use leverage, sell short, or attempt to forecast market trends.

Investment Restrictions

These are investment techniques the fund agrees not to use. Funds may state they will not buy or sell real estate, commodity contracts, or buy puts and calls, straddles or spreads, for example.

Portfolio Turnover

This section will tell you whether the fund intends to hold stocks long-term or to engage in short-term trading activity. The anticipated rate of buying and selling securities is stated along with the record for the previous three years. A 100% turnover rate for a previous year means the fund turned over its portfolio stocks completely in a year's time. A 200% rate means the average stock was held in the portfolio only six months.

Fund Management

The prospectus identifies the people who are directors or trustees and, if there is an advisory board, the members of such a board. Management's occupations for the past five years are detailed and, in the case of new funds, this may point out inexperience. One caveat: The portfolio manager—the person who actually is running the fund—will not be listed unless he is an officer of the fund.

The prospectus sets forth the essential terms of the contract with the investment adviser and the principal underwriter. The size and nature of the management fee is explained, including performance fees, if any. You may also find stockholdings, remuneration, and affiliations of management personnel.

Custodian

All funds have custodial banks which hold the assets of the fund—cash and stocks—and usually handle the administration of shareholders' accounts.

Special Services

These include reinvestment privileges, accumulation and withdrawal plans, IRA and Keogh plans.

Allocation of Brokerage

This section usually states that the primary consideration is prompt execution of orders at the

most favorable price. Many funds, however, have organizational links with brokerage firms. In these cases, the tie will be revealed and the percentage of brokerage commissions going to the affiliate noted.

Litigation

The details of any legal actions against the fund are given.

Determination of Net Asset Value

This explains how the fund computes per share value.

How to Buy Shares

In the case of load funds, this section deals primarily with load charges and their breakpoints. If an investor agrees to invest a large enough sum over a period of time to qualify for the reduced sales charges, a "Letter of intent" may be obtained.

With no-loads, this section primarily explains how to remit your money, and how to indicate if you want distributions reinvested.

How to Redeem Shares

The mechanics of selling shares back to the fund are detailed. If there is a redemption fee, it may be noted in this section. Today, many no-load funds require an authorized signature before the fund will redeem your shares. The purpose is to safeguard you from fraudulent redemptions. If the fund requires this, it will be noted.

Tax Information

The fund's policy and tax status respecting dividends and capital gain is described. Most funds distribute virtually all their net income and realized capital gains in order to qualify as a regulated investment company under the Internal Revenue Code. This means the fund acts as a conduit so that such distributions will be taxable to the shareholder only.

Financial Statements

At least three financial statements are included in the prospectus:

1. Per share income and capital changes. Included in this chart are the facts needed to compute performance. In most cases, though, it is easier to determine performance by examining the "mountain," the pictorial growth chart most established funds display in the prospectus.
2. Statement of assets and liabilities. This is the balance sheet.
3. Statements of investments. This shows the fund's portfolio and should be examined closely by the investor. By noting the types of stocks held, the investor can check the fund's objective. If it is a long-term growth fund, the stocks should be solid companies. With performance funds, expect to see small, unseasoned stocks in the portfolio.

Cost data are also shown here. Check to see whether the portfolio manager has selected a high or low percentage of winners. Cash position, an important way to determine the fund's market outlook, is also shown.

Opening a No-Load Fund Account

Buying no-load funds is a challenging do-it-yourself program in which the investor exercises the initiative. Like most do-it-yourself programs, it requires time and know-how. But in the case of no-loads, once you've learned the fundamentals, periodic evaluation shouldn't take more than one hour per month. Of course, there is the quick check, at least once a week, of your funds in the newspaper. It's well worth the effort. When success is yours—and the chances are good when you follow a logical plan—the psychic and monetary rewards of investing in no-loads are great.

Here are the steps necessary to initiate a no-load investment program.

1. Analyze your specific investment objective. How much risk are you willing to take? Will you accept great risks for maximum gains, or would you prefer a more conservative course of investing with less risk and less potential? Do you need current income, or are you saving for a long-term goal? What services do you require from a fund?

2. Learn to recognize which mutual funds are designed to meet your specific investment objective. This is the most important step and the one most neglected. Far too many investors have unknowingly bought funds either too speculative or too conservative for them—and their investment programs suffered as a result.
3. Select a number of no-load funds whose objectives coincide with your own.
4. Review past performance to determine the best two or three funds among those that meet your objective.
5. Learn the criteria for selecting those funds that are most likely to perform well in the future.
6. Then write or phone for prospectuses of two or three top-performing funds in your chosen category. You need the prospectuses to eliminate funds that are undesirable for reasons other than performance.

   You can learn from the prospectus if the fund is being sued or if expenses are abnormally high.

   The prospectus usually has an application blank, making it convenient to purchase the fund.
7. After examining the prospectuses, make a decision and invest in one or more funds.
8. Continue to follow the performance of these and other top-ranked funds.

With this plan of action, you can blueprint your own financially rewarding investment program.

If you are willing to spend some time learning about mutual funds and do some work evaluating them, you can pick top mutual funds on your own. Other no-load investors are doing it right now. So can you.

Maintaining an Open Account

Since so many mutual fund investors want to be able to add new money whenever it is convenient—or defer payments when it is inconvenient—funds provide "open accounts," also called voluntary accumulation accounts or plans.

Many mutual funds are willing to go a long way to get this kind of plan started because they have found that thousands of people begin long and worthwhile investment programs this way. But the funds ordinarily ask that the investor buy several hundred dollars' worth of the mutual fund's shares to start. Thereafter, the mutual fund will expect $25 to $50 per purchase, depending on the policy of the particular mutual fund. (One reason for the minimum payment is the cost of bookkeeping on small sums.) Some mutual funds go further, requiring that the investor buy so many dollars' worth a year if the plan is to be continued, with automatic reinvestment of capital gains and dividends.

The voluntary accumulation plan is similar to the lump sum payment in that the sales charge is deducted each time a payment is made. But it offers three advantages the investor should utilize: automatic dividend reinvestment, the ability to purchase fractional shares, and free safekeeping of your shares by a custodial bank.

The privilege of dividend reinvestment is a valuable one, enabling you to compound money as in a savings bank. Compounding gives you geometric growth instead of simple growth. With a few exceptions, it's not possible to have dividends reinvested when you buy stocks. Ordinarily, with stocks you receive small sums every quarter. These sums are difficult to put to productive use. Not so with funds. They instantly reinvest your dividends, keeping all your money working.

Mutual funds will sell you fractional shares, permitting you to invest any amount you wish, not just multiples of the fund's current offering price-per-share. For example, if you invest $500 and each fund share is currently $12, you will receive 41⅔ shares. This makes it easier to budget your savings. It is also easier on the fund, since a fund can't tell you the exact price of a share when you mail your check. You actually pay the per-share offering price at the market close the day your order is received. With fractional shares the fund doesn't incur the needless expense of reimbursing you for small amounts.

When you maintain an open account, you don't have to safeguard the share certificates. Mutual funds have custodial banks which hold your share certificates for you. This is a most convenient service you should use. It is safer, solves the problem of holding fractional shares, and makes redemptions vastly simpler.

How to Use the Statistical Tables

The following pages contain pertinent information on each of the 690 mutual funds. A brief explanation of the data on these pages appears here:

Left-Hand Pages

Mutual Fund gives the name of the fund and its address, should you wish to write for the fund's latest prospectus. Annual Performance—critical in evaluating a fund—is traced for ten years. Our method for calculating fund performance, as explained elsewhere, is to add the year's income and capital gains distributions to the fund's closing Net Asset Value (NAV) and to divide the result by the previous year's closing NAV. Then subtract "one".

What $10,000 Grew To does not include sales charges and income taxes. It summarizes the performance of funds for the last ten years. The end result figure can be converted to a percent increase by simply subtracting "one" from the first digit on the left and placing a decimal point to the left of the tens digit (the second digit from the right). For example, if $10,000 grew to $23,490, it would be a 134.9% increase. If the end result is less than $10,000, the fund declined during the period. In that case subtract the end result figure from $10,000 and convert to a percentage by moving the decimal point two places to the left. E.g., if the end result is $9,000 the fund lost $10.

Right-Hand Pages

Year Organized and Objective. The funds' objectives represent the judgment of the *ALMANAC* based on prospectuses, reports and performance, and may or may not coincide with the objectives stated by the funds themselves.

Maximum Sales Charge. Shows the fund's sales charge to the first breakpoint. The levels for larger purchases can be obtained from the fund's prospectus. "None" indicates the fund is a no-load. Some fund's shares are "not offered" and in that event may occasionally be purchased over-the-counter (noted as "OTC"). The sellers in this situation may receive more by selling OTC than by presenting their shares to the fund for redemption.

Minimum Investment. Shown in dollars or shares for initial and subsequent purchases. Some funds, principally load funds, have different minimums for accumulation plans.

Total Assets. Shown in millions for two years. If a fund's assets have grown at a faster rate than its per share value, the fund has had net sales. If the asset growth was less than the per share growth, the fund is in net redemptions.

NAV Net asset value per share at year end 1979 and 1980.

Distributions and Yield. Income and capital gains distributions paid in cash are shown for the year. (Stock dividends are omitted.) Yield is based on the year-end offering price (NAV plus the sales charge) and dividends declared from investment income in the latest year. An adjustment is made for capital gains by adding them into the offering price.

Plans. If the fund has a withdrawal plan or Keogh plan it is shown in this column. Other plans may be available; check the prospectus.

Appendix A

How Interest Rates Influence Stock and Bond Prices

Interest rates influence stock prices because they control the *present value* of corporations' *future assets*. Prevailing interest rates plus market expectations of future rates influence not only stock prices but the price of all assets which have some value in the future. So, current high interest rates have not only pushed down stock prices but bond prices and the price of real estate as well.

Present Value of Future Lump-sum Payments

Suppose that you are promised the lump sum of $1 million thirty years from today. Assume that there is no risk of default; the million will be yours come hell or high water. Market expectations of interest rates over the next thirty years will determine the present value of that promised $1 million.

To determine the present value, you must know what amount of money invested today at what compound interest rate will equal $1 million thirty years from now. Because of the compounding effect—interest earned in one period itself earning interest in the next—the seemingly large sum of $1 million has a value of only about one-thirtieth of that amount today.

The Discount Rate

The length of time and the interest rate are factors used to equate future sums of money to present values. This process is called *discounting*, and the interest rate used is called the *discount rate*. The higher the discount rate, the less a future sum is worth today, and vice versa. The farther in the future a sum of money lies, the less it is worth today.

Table A shows the present value of $1 million at various discount rates for two time periods.

Table A
PRESENT VALUE OF 1 MILLION FUTURE DOLLARS

Discount Rate	Due in 20 Yrs.	Due in 30 Yrs.
5%	$376,889	$231,377
8%	214,548	99,377
10%	148,643	57,309
12%	103,667	33,378
15%	61,100	15,103
18%	36,506	6,975
20%	26,084	4,213

The table shows that changes in either the discount rate or the time over which money is discounted bring greater than proportional changes in its present value. For example, doubling the discount rate from 10% to 20% shrinks the present value of money due in twenty years to less than one-fifth ($26,084 vs. $148,643). A 50% increase in the time to payout (from twenty to thirty years) causes a large decrease in the present value of future returns.

The wide swings in the present value of future returns caused by relatively small changes in the discount rate show how easily a change in *expectations* about future interest rates can cause large changes in the present value of future returns.

It is small wonder, then, that today's investment markets are driven by interest rate expectations, with every developing nuance of government policy, every jiggle in the monetary aggregates causing immediate and sharp adjustments.

Calculating the Present Value of Bonds

The market prices of long-term bonds don't fluctuate as sharply as the present value of $1 million,

because unlike our example—a lump-sum payment in the future—a stream of interest payments accrue to the holder over the time he holds it, and when the bond matures, the principal is repaid. The fact that a bondholder doesn't have to wait until maturity to get his interest—that some money is paid every year—means that the present value of the bond is heavily weighted by the present value of the interest payments in early years.

Conceptually, the present value of an obligation yielding periodic payments is determined by a process identical to that by which the present value of a lump-sum payment (like the $1 million in our example) is calculated. In both cases, the future payment(s) are discounted back to the present and totaled. In the case of a bond with a 10-year maturity paying interest yearly, the present value would be calculated as follows:

present value of bond =
present value of interest paid in year 1 +
present value of interest paid in year 2 +
present value of interest paid in year 3 +
present value of interest paid in each year through year 10 +
present value of principle returned in year 10.

The Coupon Rate in Present Value Calculations

Note that the stated rate of interest the bond pays—the *coupon rate*—does not enter into this calculation because once issued, the bond is a promise to pay certain amounts of money at certain intervals. *These amounts of money discounted to the present* control the present value of the bond.

As an example, take the case of a newly issued U.S. Government (i.e. risk-free) bond maturing in 10 years and paying interest yearly. Each $1,000 bond pays $150 yearly interest. The coupon rate on the bond is 15%; buyers of the bond expect future interest rates to remain at 15%, so they pay full value for the bonds.

But suppose shortly therafter there is a change in government policy, and the general consensus in the market place is that interest rates will be 12% over the next 10 years. What changes will this cause in the value of each $1,000 bond? Table B shows the present value of such a $1,000 bond.

Table B

PRESENT VALUE OF COUPONS AT 15% AND 12%

Year	Payment	Present Value at 15%	Present Value at 12%
1	$ 150	$ 130.43	$ 133.93
2	150	113.42	119.58
3	150	98.63	106.77
4	150	85.76	95.33
5	150	74.58	85.11
6	150	64.85	75.99
7	150	56.39	67.85
8	150	49.04	60.58
9	150	42.64	54.09
10	150	37.08	48.30
10	1,000	247.18	321.97
		$1,000.00	$1,169.50

The present value columns show the amount of money that would have to be invested today at 12% or 15% to equal the payment promised in the future year. Thus, $64.85 invested for six years at 15% compounded annually would yield $150, while $75.99 at 12% over the same period would yield a similar $150.

Table B shows that a 20% drop in the expected interest rate (from 15% to 12%) has produced only a 16.95% increase in the value of the bond. But the present value of the principal returned in 10 years has increased some 30%, from $247.18 to $321.97. Thus, it is the "cash up front" that stops the bond's present value from fluctuating as much as interest rates. Under both interest rate assumptions, more than half the present value of the bond is contributed by interest paid during the first five years. The present value of the returned principal in year 10 is only about one quarter of the total.

So, during periods of high interest rates, money in the future isn't worth very much today. Evaluate any investment promising huge returns

far in the future on a *discounted basis*. Those huge returns, even if they are certain, will look quite modest when discounted to the present. And if they are adjusted for risk they may disappear altogether!

But the reverse is also true. Should we ever return to the halcyon days of low interest rates, investments with payoffs in the distant future would once again look attractive. And those investors willing to bet on it could reap an immediate reward of rising present values if expectations of future rates decline.

Present Value of Common Stocks

Common stocks can be valued using present-value techniques just as bonds can, but with one additional factor considered—growth. Unlike a bond, a share of common stock yields a stream of payments which (it is hoped) increase over the years. And unlike bonds, common shares never have a redemption date when they cease paying dividends. There are additional risks with common stocks, but more about that later.

How do we arrive at the present value of a share of a particular company? Like bonds, by discounting the future stream of dividends back to the present. Before the dividends are discounted, however, some growth rate must be applied. Table C shows the present value of the first 10 years of dividends from a share of stock which has an initial dividend of $0.95. The growth rate of the dividend is assumed to be 5% annually, and the discount rate is assumed to be 15%.

Table C

Year	Dividend	Present Value
1	$1.000	$ .952
2	1.050	.913
3	1.103	.834
4	1.158	.761
5	1.216	.695
6	1.276	.634
7	1.340	.579
8	1.407	.529
9	1.477	.483
10	1.551	.441
		$6.869

The dividend in year 10 is worth about 44¢ today. Based on 10 years of expected dividends, the share of stock has a present value of $6.87.

But we must calculate the present value of dividends beyond year 10, because they have a significant value. Fortunately, about 100 years ago a simple formula was discovered which relates initial dividends, a discount rate, and a growth rate to present value. It is

$$P = \frac{D_1}{k - g}$$

Formula 1

where "P" is the present value of an infinite stream of income growing at a rate "g" discounted at a rate "k" (g and k are expressed as decimals, and g must be less than k). D_1 is the first year dividend rate. Applying the formula to our example, we have

$$P = \frac{\$1.00}{.15 - .05}$$

Formula 2

so the present value of the dividends beyond year 10 is $3.13 ($10.00 − $6.87). Fairly sophisticated techniques have been developed by investment banking firms, management consultants, and academics to estimate discount rates and growth rates.* Some common problems have been solved:

1. Stocks that don't pay dividends. Not all stocks pay dividends. But every company that has decided *not* to pay dividends promises some day to do so. In this case, the dividends starting some years in the future are discounted back to the present. Or, the value of the stock can be calculated as of the date they are expected to start paying dividends and this value can be discounted to the present.

A more solid technique for evaluating companies that don't pay dividends is to calculate the growth of assets of the company using corporate finance techniques, decide how the market will capitalize those assets and their earning power in the future, and then discount the capitalized value back to the present.

*See, for example, R.G. Ibbotson and R.A. Sinquefield, "Stocks, Bonds, Bills and Inflation: Historical Returns (1926–1978)" *Financial Analysts Research Foundation.*

2. Super normal growth. In many growth companies, growth exceeds the discount rate (g is greater than k), in which case the formula doesn't apply. But this is only a temporary condition; a company can't grow faster than the GNP forever.

Changes in investor expectations regarding both interest rates and growth rates control share prices. In our example, the share value would rise to $20.00 if the discount rate fell to 10% or the growth rate rose to 10%. In either case the denominator would equal .05, capitalizing the dividend stream at $20. In the case of g = 0 (no growth), the example reduces to that of a perpetual bond, i.e. a bond paying a fixed periodic sum but without maturity. (The British government actually issued such bonds in the last century, and the Canadian government has experimented with perpetual bonds more recently.)

From Formula 1 one can easily see why growth stocks are more volatile than the stock of mature companies. With growth stocks, g and k are close together in value. A small change in either causes a comparatively large change in the formula's denominator which in turn causes wide swings in the present value. For example, take a low-growth company (g = 4%) and a high-growth company (g = 10%) each paying an equal dividend and calculate the share price change assuming various one or two percentage point changes in the discount rate and the growth rate.

Present Value of Common Stocks in the Real World

Formula 1 is difficult to apply in the real world because k and g are not directly observable but must be estimated. At some point growth will slow as the company and/or its markets mature. This case can be handled as in Problem 1 (above).

3. Estimating the Discount Rate k. An appropriate estimate of a discount rate was researched by Ibbotson and Sinquefield considering stock and bond returns over a fifty year period, 1926–1976. Since long-term government bonds have historically yielded 1.2% over the rate of inflation, the long-term government bond rate (LTGBR) can be interpreted as the risk-free real rate of return demanded by the market. The study also showed that the average stock on the New York Stock Exchange (NYSE) had a total average yield over the same period (total yield = dividends + capital gains) of 7.6% annually over the LTGBR. The additional 7.6% can be understood as a risk premium demanded by investors as a price to compensate them for the increased risk of holding equities.

Not all stocks are as risky as the average NYSE stock. Beta is the measure of risk of a stock relative to the market; the higher the beta, the riskier the stock. The average beta is 1.0. By adjusting the 7.6% average risk premium for the actual risk of a particular stock, a fairly accurate measure of that stock's discount rate can be calculated:

$$k = LTGBR + 7.6 \times beta$$

Formula 3

This equation (Formula 3) is called the *Capital Asset Pricing Model* because it calculates the discount rate (k) by which future returns from equities can be equated to present values, and also the *cost of capital* to a firm selling its equity to investors.

> The discount rate to the investor is the same as the cost of equity capital to the corporation.

The cost of capital is important in corporate finance because it is the "hurdle rate" which the company will have to make in earnings (i.e. return on equity) to maintain the price of its stock.

4. Non-uniform g and k. These two variables may not remain constant over the length of time under study. If so, the present value can always be calculated from a long form of the formula. Also, two and three stage growth models can be derived which will allow for different rates of growth and different discount rates. Future discount rates may be estimated by comparing the present values of bonds with different maturities.

Appendix B

Reference Tables

The tables in this section are intended for reference and to help the reader plan an investment program. The first three tables show the historical performance of a number of popular indexes. The next three tables show how capital accumulates under a number of compounding and accumulation schedules. Finally, life tables are included to aid in estate planning.

Table A-1. Standard & Poor's 500 Index and the Consumer Price Index

The S & P 500 is a broad-based index representative of the stock market. The CPI is an index of actual retail prices of goods and services based on a monthly national survey. Dividends are at an all-time high, and the yield of a "share" of the index is also higher than it has been in almost 30 years. The reason is that dividends have increased steadily. The value of a share has remained constant, thus increasing the yield. The S & P Index showed rapid growth during the period of stable prices that lasted from the end of the Korean War until the beginning of the Vietnam War. With rapid inflation beginning in the mid-1960s, however, the level of stock prices has shown little growth.

Table A-2. The Dow-Jones Industrial Average and Moody's Aaa Bond Yield

The thirty industrials which make up the DJI index represent about one-quarter of the value of New York Stock Exchange stocks. They are the largest industrial companies in the United States. Like the S & P 500 index, dividends per "share" of the DJI have been steadily increasing, as has the yield. Moody's Aaa bond rating represents the most creditworthy corporate issues. But the spread between the yield of the Dow Aaa bonds also has been increasing and is now at a historic high, because of investors' fears of re-emerging inflation and insatiable demands for credit by corporations.

Table A-3. Weekly Close of Popular Indexes

This table shows the movement of a number of widely followed indexes on a weekly basis. Figures are for the Friday date shown. When Friday was a no-trade date, the previous day's figures are shown.

In addition to the DJI and S & P 500 indexes, the table shows the New York Stock Exchange Composite Index, the American Stock Exchange (AMEX) average, and the National Association of Securities Dealers index covering over-the-counter securities.

Corporate bonds are represented by the yield (in percent) of Moody's Aaa industrial bonds, and short-term government obligations are shown by the yield on three-month Treasury bills. Gold is quoted in dollars per Troy ounce as determined by the London p.m. fixing.

Table A-4. Value of $1 Compounded Monthly and Table A-5. Value of $1 Compounded Annually

The increase in value of an investment depends on the rate of return (or interest) it can earn and the length of time it is earning that return. These two interest rate tables—one for annual and the other for monthly compounding—show how time and interest rates combine to make money grow. Time is in years, from one to 30, and interest rates are from 0.5% to 25%. The tables can be used in a number of ways:

• To determine what an investment will grow to, determine what $1 will grow to and multiply that figure by the initial value of the investment. For example, to calculate what $2,000 will grow to in 15 years at 12% compounded monthly, first use the monthly compounding table to look up the value of $1 for 15 years at 12%. That figure is $4.19, which, when multiplied by the initial investment of $2,000, yields the answer: $8,380.

• To determine how long it takes an investment to grow to a certain size at a stipulated interest rate, divide the future value of the investment by the present value. Then, look in the column under the chosen interest rate to find the number closest to the number you have calculated. Look across to find the number of years it will take to reach the future value. For example, suppose you have $2,000 to invest and would like to see it grow to $10,000. You can invest the $2,000 at 11%, compounded monthly. First, divide $10,000 by $2,000 to get $5. Then, look under the 11% column in the monthly compounding table to find the number closest to 5. We can see that 14 years is 4.63 and 15 years is 5.17, so the time necessary to make $2,000 grow to $10,000 is somewhere between 14 and 15 years.

• To find the interest rate necessary to make an investment grow to a certain size in a stipulated time period, divide the future value of the investment by the present value, as above. Then, select the number of years and read across until you find the number closest to the one you have calculated. For example, to find the interest rate necessary to make $2,000 grow to $10,000 in eight years, divide $10,000 by $2,000 to get $5 as before. Then read across the table next to eight years and note that the value of $1 is $4.89 at 20% and $5.29 at 21%. The answer, then, is that it will require a return of 20% to 21% to make money quintuple in five years.

Table A-6. Value of $1 Invested Monthly

This table shows how a continuous investment program builds up sizable savings. As with the previous two tables, years are listed down the side and interest rates expressed as a percent are across the top. The figures within the table are in whole dollars.

• To find the future value of a monthly savings program, find the future value for $1 monthly and multiply by the monthly contribution. Thus, $100 invested monthly at 10% for 10 years would total $100 × 205 = $20,500.

• To determine how much to invest monthly to reach a certain savings objective, determine the interest rate available to you and the number of years over which you will invest. Then divide the figure in the table into the sum you want to accumulate to get the monthly investment. Suppose you would like to accumulate $100,000 in 12 years and you can invest at 13%. From the table you determine that each $1 invested monthly at 13% for 12 years will yield $343. $343 divided into $100,000 gives $291.55, the monthly investment needed.

• You can find what various combinations of monthly investments, interest rates and years will bring by remembering that the figures in this table are for $1 invested monthly. Multiply the value of $1 invested by the monthly investment to determine the future value of your investment.

Table A-7. Life Tables

Compiled by the U.S. Department of Health and Human Services, this table includes both expectation of life by age and the number of survivors per 100,000 live births. The table covers the U.S. population as a whole. Life tables published by insurance companies are based on the mortality experience of insured persons only and thus show more longevity as high underwriting risks are excluded. Look up your age in the far left column and move over to the expected life column to determine the number of years you are expected to live. This table will assist you in planning for your retirement needs, such as when you need to make withdrawals from your IRA, Keogh, or mutual fund withdrawal program.

Appendix C

GLOSSARY

ACCUMULATION PLAN

An arrangement by which an investor can purchase mutual fund shares periodically in large or small amounts, usually with provisions for the reinvestment of income dividends and the acceptance of capital gains distributions in additional shares. Plans are of two types, voluntary and contractual.

ADVISER OR INVESTMENT ADVISER

The organization which is employed by the fund's management to give professional advice and to supervise and administer its assets.

ASKED PRICE

The asked price of a fund share refers to the net asset value per share plus sales charge, if any.

BALANCED FUND

A mutual fund which has an investment policy of "balancing" its portfolio, generally by including bonds, preferred stocks, and common stocks.

BLUE CHIP

The common stock of a large, well-known corporation with a relatively stable record of earnings and dividend payments over a period of many years.

BLUE SKY LAWS

Laws of the various states governing the sale of securities, including mutual fund shares, and the activities of brokers and dealers within the particular state.

BOND

A security representing debt—a loan from the bondholder to the corporation.

BOND FUND

A mutual fund whose portfolio consists primarily of bonds. The emphasis is normally on income rather than growth.

BOOK SHARES

A modern share-recording system which eliminates the need for mutual fund share certificates but gives the fund shareowner a record of his holdings. Also called uncertificated shares.

BREAKPOINT

Dollar-value level of a purchase of mutual fund shares at the precise point where the percentage of the sales charge decreases. A typical sales charge schedule includes five or six breakpoints.

BROKER

A person in the business of effecting securities transactions for others. He receives a commission for his services. Closed-end investment company shares are usually bought and sold through brokers.

CALL

An option contract that gives the holder the right to purchase a particular security from another party at a pre-specified price during the term of the option.

CAPITAL GAINS

Long-term profits which are realized from the sale of securities held for more than one year, whereas *short-term* profits refer to such sales when the security is held one year or less.

CAPITAL GAINS DISTRIBUTION

Payments to mutual fund shareholders of gains realized on the sale of the fund's portfolio

securities. These amounts usually are paid once a year. Many funds offer their shareholders a choice of accepting these dividends in cash or in fund shares of equal value.

CAPITAL GROWTH

An increase in market value of securities. This is a long-term objective of many investors and investment companies.

CASH EQUIVALENT

Includes receivables, short-term U.S. Government securities, commercial paper and short-term municipal and corporate bonds and notes.

CERTIFICATES OF DEPOSIT

Generally short-term interest-bearing negotiable certificates issued by commercial banks or savings and loan associations against funds deposited in the issuing institution. (Euro CDs—Issued by foreign branches of U.S. banks or U.S. branches of foreign banks.)

CONTRACTUAL PLAN

An accumulation plan under which the total intended investment is stated, with a specified payment period and provision for regular monthly or quarterly investments. A substantial portion of the total sales charge is deducted from the first year's payments.

CONVERSION PRIVILEGE

See Exchange Privilege.

CUSTODIAN

The organization—a bank or a trust company—which holds in custody and safekeeping the securities and other assets of a mutual fund.

DEALER

A person or firm who regularly buys and sells securities. Mutual fund shares are usually purchased through dealers.

DEBENTURE

A bond secured only by the general credit of the corporation.

DIRECT PURCHASE FUND

A no-load or low-load mutual fund. Investors purchase shares directly from the fund, rather than through an investment dealer or broker.

DISTRIBUTIONS

Dividends paid from net investment income and payments made from realized capital gains.

DISTRIBUTOR

The principal underwriter—either a person or company—that purchases open-end investment company shares directly from the issuer for resale to others.

DIVERSIFICATION

The mutual fund policy of spreading investments among the number of different securities to reduce the risk inherent in investing. Diversification may be among types of securities, different companies, different industries, or geographical locations.

DIVERSIFIED INVESTMENT COMPANY

To be so classified, the Investment Company Act requires that 75% of a fund's assets be allocated so that not more than 5% of its total assets are invested in one company. In addition, it can hold no more than 10% of the outstanding voting securities of another company.

DIVIDEND

A payment from income on a share of common or preferred stock.

DOLLAR-COST AVERAGING

A policy of investing equal amounts of money at regular intervals regardless of whether the stock market is moving upward or downward. This reduces average share costs to the investor

who acquires more shares in periods of lower securities prices and fewer shares in periods of higher prices.

DUAL-PURPOSE FUND

A type of investment company, introduced to the United States from England in early 1967, which is designed to serve the needs of two distinct types of investors: (1) those interested only in income and (2) those interested solely in possible capital growth. Has two separate classes of shares.

EQUITY FUND

A mutual fund that invests in stocks.

EXCHANGE FUND

An investment company organized to permit persons holding individual securities with large unrealized capital appreciation to exchange these securities, without payment of capital gains tax, for funds shares to achieve diversification and to obtain professional investment management.

EXCHANGE PRIVILEGE

The right to exchange the shares of one open-end fund for those of another under the same sponsorship at nominal cost or at a reduced sales charge. This is considered a sale and new purchase for tax purposes. (Same as conversion privilege.)

EX DIVIDEND

When a dividend is declared by a corporation, it is payable on a designated date to stockholders of record as of a certain date. NYSE rules that in the case of a stock sold three business days prior or subsequent to stated date and prior to the date of payment, *the dividend belongs to the seller and not to the buyer.*

EXPENSE RATIO

The proportion that annual operating costs —excluding income taxes and interest paid— bear to average net assets for the year.

FAIR VALUE

Under the Investment Company Act, value determined in good faith by the board of directors for those securities and assets for which there is no market quotation readily available.

FIDUCIARY

An individual who is granted legal rights and powers to be exercised for the benefit of another.

FORWARD PRICING

The policy by which mutual fund shares are priced for sale or redemption at the price next computed after the receipt of an order. Pricing is usually done once a day at the close of the NYSE.

FULLY MANAGED FUND

While this term can be applied to most investment companies, it is sometimes used in a more restricted context to describe a fund lacking any restrictions on its securities portfolio or the extent of cash and equivalents it may hold.

GROWTH FUND

A mutual fund with growth of capital a primary objective to be obtained principally through investments in common stocks with growth potential.

GROWTH–INCOME FUND

A mutual fund with the objective of providing both income and long-term growth.

INVESTMENT OBJECTIVE

The specific goal, such as long-term capital growth, or current income, which the investor or mutual fund pursues.

IRA

See Individual Retirement Account.

KEOGH PLAN

A retirement program for self-employed individuals and their employees based on tax-saving provisions. A Keogh plan may be funded

with mutual fund shares. (Also known as H.R. 10 Plans.)

LEGAL LIST

List published by a state government that set standards or specifically enumerates those securities that are proper investments for trust funds.

LETTER OF INTENTION

A pledge to purchase a sufficient amount of shares of a load fund within a limited period (usually 13 months) to qualify for the reduced selling charge that would apply to a comparable lump-sum purchase.

LEVERAGE

The effect of the use of borrowed money or other senior securities, magnifying the changes in the assets of earnings available for junior issues.

LIQUID

Easily convertible into cash or exchangeable for other values.

LIQUID ASSET FUND

A money market or cash management fund invested in short-term securities.

MANAGEMENT FEE

The amount paid to the investment advisor for its services.

MONEY MARKET FUND

Mutual funds investing in short-term money market instruments—bank certificates of deposit, bankers' acceptances, commercial paper and short-term government securities.

MUNICIPAL BOND FUND

Unit investment trust or open-end company whose shares represent diversified holdings of tax-exempt securities, the income from which is exempt from federal taxes.

MUTUAL FUND

An open-end investment company which combines the money of many people whose investment goals are similar and invests this money in a wide variety of securities.

NATIONAL ASSOCIATION OF SECURITIES DEALERS (NASD)

An organization of brokers and dealers in the over-the-counter securities market which administers rules of fair practice to prevent fraudulent acts, for the protection of the investing public.

NET ASSET VALUE PER SHARE

The market worth of an investment company's total resources—securities, cash and any accrued earnings—after deduction of liabilities divided by the number of shares outstanding.

NET REALIZED CAPITAL GAIN PER SHARE

The amount of capital gains realized on the sale of portfolio securities of a fund during an accounting period after deducting losses realized, divided by the number of shares outstanding.

NO-LOAD FUND

See Direct Purchase Fund

OFFERING PRICE

The asked price.

OPEN-END INVESTMENT COMPANY

The more formal name for a mutual fund. The words open-end indicate that it continuously offers new shares to investors and redeems them on demand.

OPTION FUNDS

A mutual fund which sells options on shares it owns to increase its income.

PAYROLL DEDUCTION PLAN

An arrangement whereby an employee may accumulate shares in a mutual fund by authoriz-

ing his employer to deduct and transfer to a fund a specified amount from his salary at stated times.

PERIODIC PAYMENT PLAN

An accumulation plan.

PERFORMANCE FUND

A term generally applied to open-end investment companies which appear to emphasize short-term results and which have usually had rapid turnover of portfolio holdings. May also refer to funds with outstanding records of capital growth, regardless of policies by which results were achieved.

PORTFOLIO

The securities owned by an investment company.

PROSPECTUS

The official booklet which describes a mutual fund and offers its shares for sale. It contains information as required by the Securities and Exchange Commission on such subjects as the fund's investment objectives and policies, services, investment restrictions, officers and directors, how shares can be bought and redeemed, its charges and its financial statements.

PUBLICLY TRADED FUND

A closed-end investment company.

PUT

An option contract that gives the holder the right to sell a particular security to another party at a pre-specified price during the term of the option.

QUALIFIED RETIREMENT PLAN

A private retirement plan that meets the rules and regulations of the Internal Revenue Service. Contributions to a qualified retirement plan are in almost all cases tax deductible and earnings on such contributions are always tax sheltered until retirement.

REDEMPTION PRICE

The amount per share the mutual fund shareholder receives when he cashes in his shares (also known as "liquidating price" or "bid price"). The value of the shares depends on the market value of the company's portfolio securities at the time.

REINVESTMENT PRIVILEGE

A service provided by most mutual funds for the automatic reinvestment of a shareholder's income dividends and capital gains distributions in additional shares.

ROUND LOT

A fixed unit of trading (usually 100 shares) to which prevailing commission rates by a broker will apply.

SALES CHARGE

The amount charged in connection with public distribution of fund shares. It is added to the net asset value per share in computing the offering price and is paid to the dealer and underwriter.

SECURITIES AND EXCHANGE COMMISSION (SEC)

An independent agency of the U.S. Government which administers the various federal securities laws for the protection of investors.

SHORT SALE

The sale of a security which is now owned, in the hope that the price will go down so that it can be repurchased at a profit. The person making a short sale borrows stock in order to make delivery to the buyer and must eventually purchase the stock for return to the lender.

SPECIALTY FUND

A mutual fund specializing in the securities of certain industries, special types of securities, or in regional investments.

SPLIT FUNDING

A program which combines the purchase of mutual fund shares with the purchase of life insurance contracts or other products.

TAX-FREE FUND

A mutual fund whose portfolio consists of securities (usually municipal bonds) exempt from federal income tax.

TRANSFER AGENT

The organization which is employed by a mutual fund to prepare and maintain records relating to the accounts of its shareholders.

TURNOVER RATIO

The extent to which an investment company's portfolio is turned over during the course of a year. For a closed-end company, total purchases and sales of securities (other than U.S. Government obligations and short-term notes) are divided by two and then divided by average assets. For a mutual fund, a rough calculation can be made by dividing the lesser of portfolio purchase or sales (to eliminate the effects of net sales or redemptions of fund shares) by average assets.

UNCERTIFICATED SHARES

Ownership of fund shares credited to a shareholder's account without the issuance of stock certificates.

UNDERWRITER OR PRINCIPAL UNDERWRITER

The organization which acts as chief distributor of a mutual fund's shares; it is often the same as or affiliated with the advisor.

UNREALIZED APPRECIATION OR DEPRECIATION

The amount by which the market value of portfolio holdings on a given date exceeds or falls short of their cost.

VARIABLE ANNUITY

An insurance annuity contract under which the dollar payments received are not fixed but fluctuate with average common stock prices.

VOLUNTARY PLAN

An accumulation plan without any stated duration or specific requirements other than a specified minimum investment at one time. Sales charges are applied to each purchase as it is made.

WITHDRAWAL PLAN

An arrangement many open-end companies have which enables investors to receive fixed payments—usually monthly or quarterly. The actual payout is to be determined by the investor.

YIELD

Income received from investments, usually expressed as a percentage of market price; also referred to as return.
